**Supplementary Figure 1.** A diagram of the overall meta-analysis study design for waist-hip ratio adjusted for BMI (WHRadjBMI) with counts of cohorts, subjects, and SNPs analyzed. Data (dashed lines) and analyses (solid lines) related to the genome-wide association study (GWAS) cohorts are colored red and those related to the Metabochip (MC) cohorts are colored blue. The two genomic control ( $\lambda_{GC}$ ) corrections (within-study and among-studies) performed on associations from each dataset are represented by gray-outlined circles. The joint meta-analysis of the GWAS and MC datasets is colored purple. All SNP counts reflect a sample size filter of  $N \geq 50,000$  subjects. Additional WHRadjBMI meta-analyses included Metabochip data from up to 14,371 subjects of East Asian, South Asian, or African American ancestry from eight cohorts. Counts for the meta-analyses of waist circumference (WC), hip circumference (HIP), and their BMI-adjusted counterparts (WCadjBMI and HIPadjBMI) differ from those of WHRadjBMI because some cohorts only had phenotype data available for one type of body circumference measurement (see Supplementary Table 2).

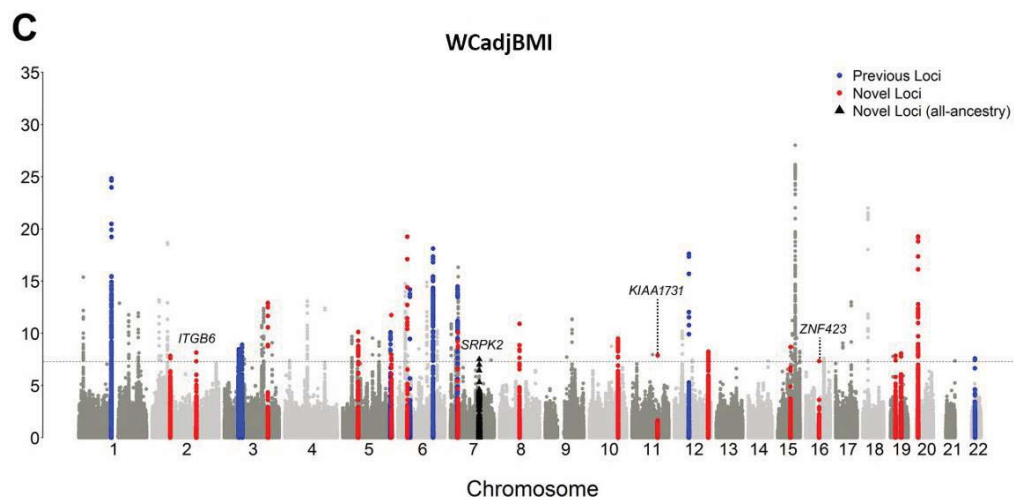

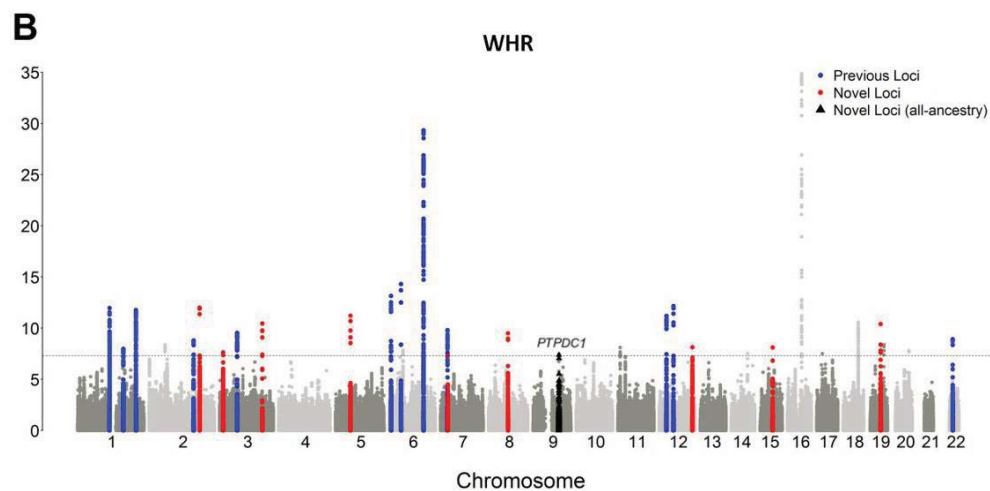

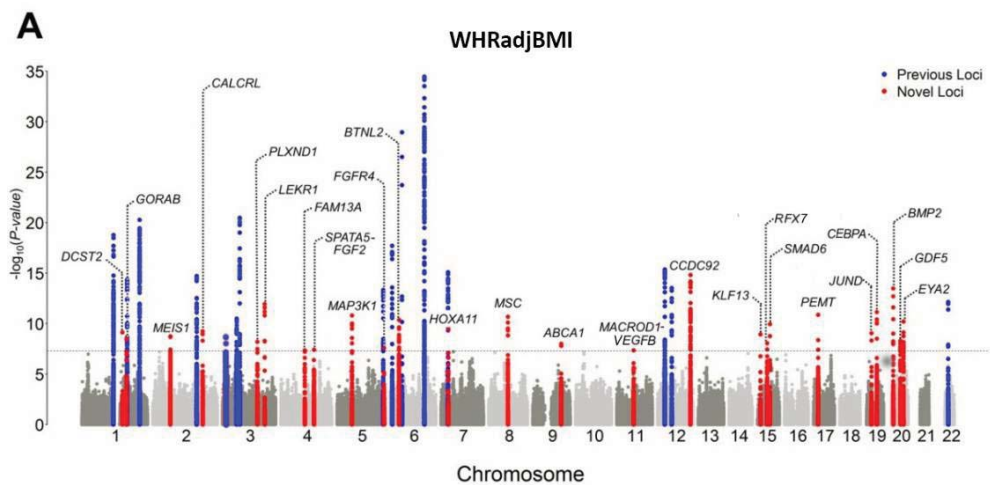

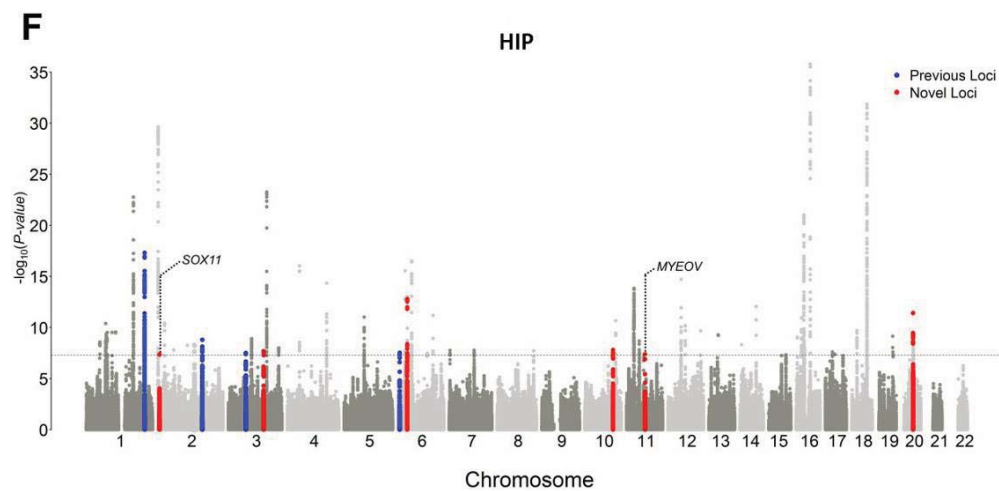

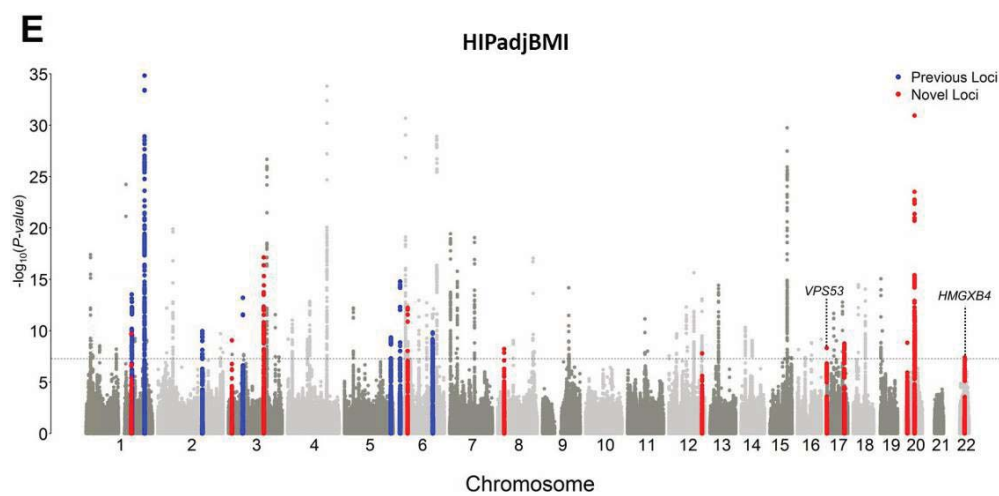

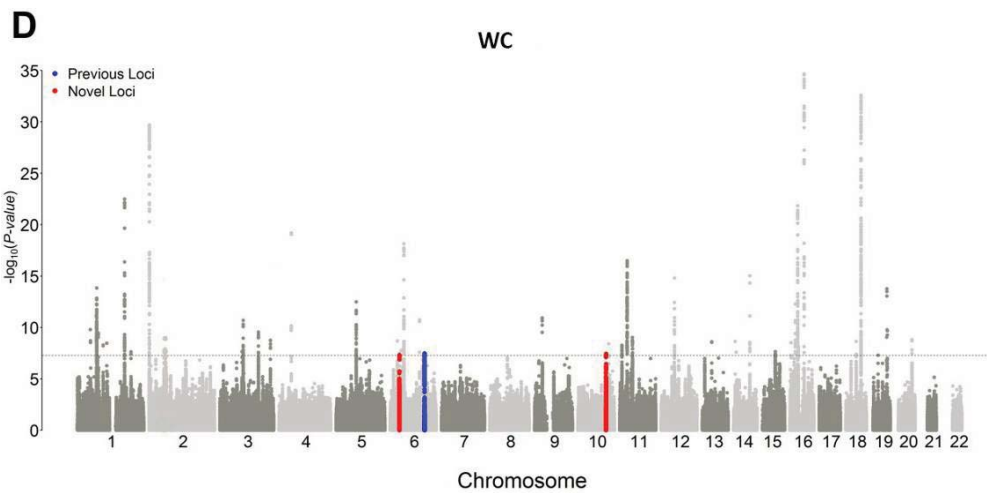

**Supplementary Figure 2.** Quantile-quantile plots of (A, C, E, G, I, K) sex-combined and (B, D, F, H, J, L) sex-specific SNP associations with six waist-related traits (waist-hip ratio (WHR), waist circumference (WC), and hip circumference (HIP), adjusted and not adjusted for body mass index (BMI)). Only SNPs with  $N \geq 50,000$  samples are shown. In the panels containing sex-combined data, SNPs are marked in black. In the WHR data (A), after removing all SNPs within 500 kb of the 16 previously reported WHR loci the remaining SNPs are colored green and after removing all SNPs within 500 kb of the 48 WHR loci reported in **Table 1** the remaining SNPs are colored purple. In the panels containing sex-specific data, the SNPs are colored red for female-specific associations and blue for male-specific associations. In each panel, the uniform null distribution is marked with a solid black line and the related 95% confidence interval is marked with dashed gray lines. While the substantial departure from the null distribution suggests an excess of strongly associated SNPs in each panel, the corresponding genomic control values do not suggest strong evidence of systematic association inflation ( $\lambda_{GC} = 1.01\text{--}1.05$ ).

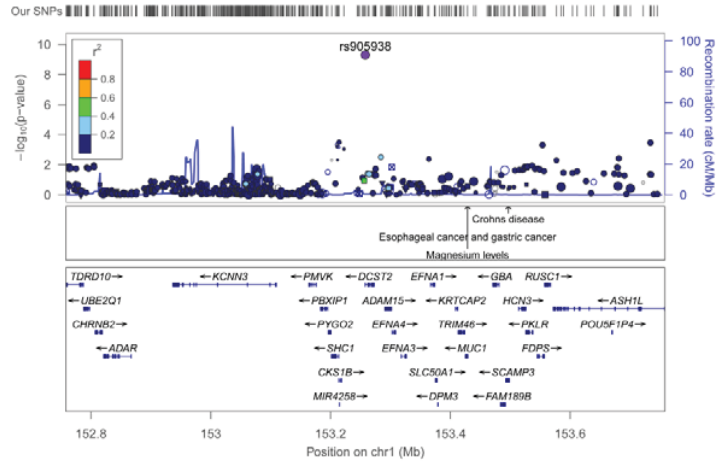

**Supplementary Figure 3.** Manhattan plots of sex-combined SNP associations for six waist-related traits (waist-hip ratio (WHR), waist circumference (WC), and hip circumference (HIP), with and without adjustment for body mass index (adjBMI)). Only SNP results with  $N > 50,000$  samples are shown. Dashed gray lines mark statistical significance at the genome-wide level ( $P = 5 \times 10^{-8}$ ). Novel loci achieving genome-wide significance in sex-combined WHR association analysis in Europeans are highlighted in red on all figures (**A–F**) and annotated in panel **A**. Novel loci achieving genome-wide significance in Europeans in other waist-related traits (**B–F**) are highlighted in red and annotated only on the relevant figure. Previously established loci are highlighted in blue (**A–F**). Additional novel loci achieving genome-wide significance when all ancestries were analyzed are marked as black triangles and annotated. SNP association signals that achieve genome-wide significance and are previously established height or BMI loci are shown in light or dark grey. Detailed information about the loci is presented in **Tables 1–3** and **Supplementary Tables 4 and 31**.

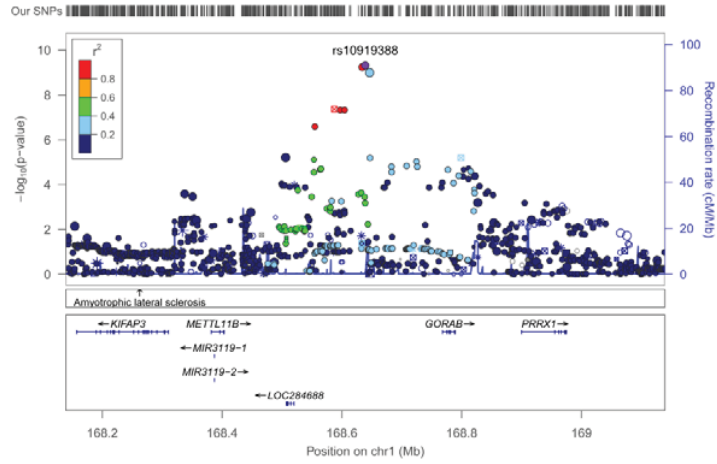

**Supplementary Figure 4.** Regional association plots for 68 novel loci achieving genome-wide evidence of association with six waist-related traits (waist-hip ratio (WHR), waist circumference, and hip circumference, adjusted and not adjusted for body mass index (BMI)) that do not overlap with association signals with height or BMI. Plots are arranged in the same order as **Tables 1** and **3**.

**Supplementary Figure 5.** Chicago plots (**A–F**) of sex-specific SNP associations for six waist-related traits (waist-hip ratio (WHR), waist circumference (WC), and hip circumference (HIP), with and without adjustment for body mass index (adjBMI)). Only SNP results with  $N > 50,000$  samples are shown. Dashed gray lines mark statistical significance at the genome-wide level ( $P = 5 \times 10^{-8}$ ). Novel loci achieving genome-wide significance in sex-stratified WHR association analysis in Europeans are highlighted in red on all figures (**A–F**) and annotated on figure **A**. One additional novel locus achieving genome-wide significance when all ancestries were analyzed is marked as black triangles and annotated on figure **A**. Novel loci achieving genome-wide significance in Europeans in other waist-related traits (**B–F**) are highlighted in red and annotated only on the relevant figure. Previously established loci are highlighted in blue (**A–F**). Additional novel loci achieving genome-wide significance when all ancestries were analyzed in other waist-related traits (**B–F**) are marked as black triangles and annotated. SNP association signals that achieve genome-wide significance and are previously established height or BMI loci are shown in light or dark grey. Detailed information about the loci is presented in **Tables 1–3** and **Supplementary Tables 4 and 29**.

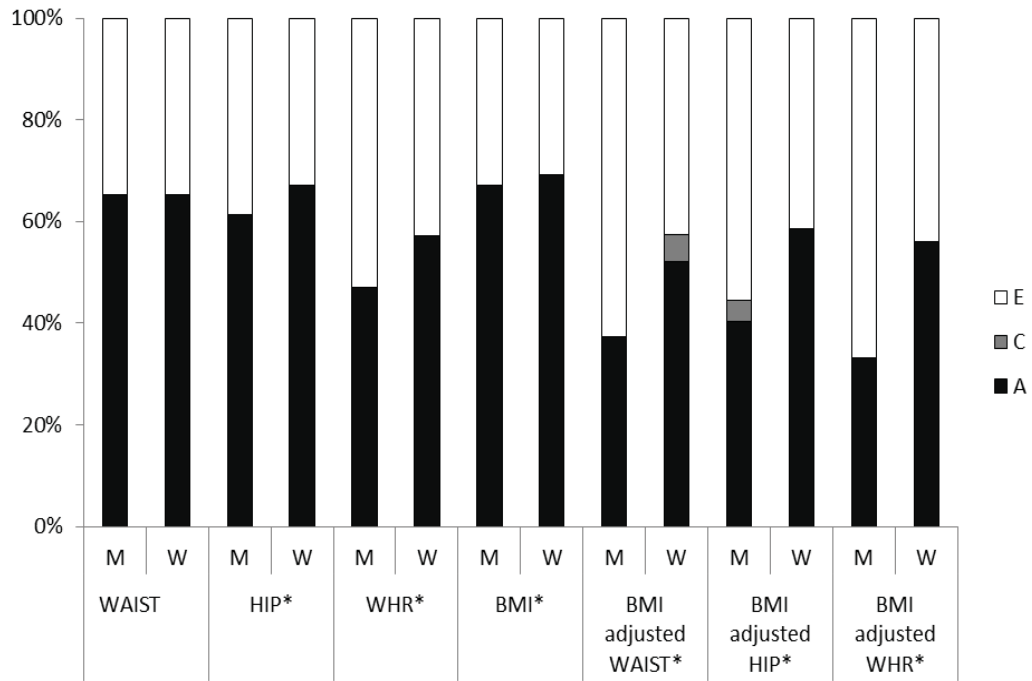

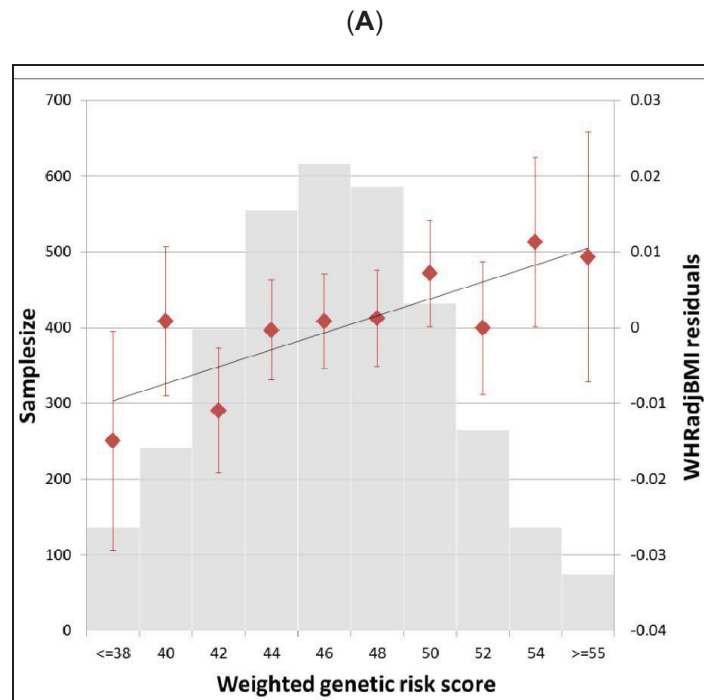

**Supplementary Figure 6.** Women- and men-specific effect beta estimates with 95% confidence intervals (red circles and blue squares, respectively) are shown for the 20 WHRadjBMI SNPs showing significant evidence of sexual dimorphism. The SNPs are classified into three categories: (i) those showing a female-specific effect ("Women SSE"), namely a significant effect in women and no effect in men ( $P_{\text{women}} < 5 \times 10^{-8}$ ,  $P_{\text{men}} \geq 0.05$ ), (ii) those showing a pronounced female effect ("Women CED"), namely a significant effect in women and a less significant but directionally consistent effect in men ( $P_{\text{women}} < 5 \times 10^{-8}$ ,  $5 \times 10^{-8} < P_{\text{men}} \leq 0.05$ ); and (iii) those showing a male-specific effect ("Men SSE"), namely a significant effect in men and no effect in women ( $P_{\text{men}} < 5 \times 10^{-8}$ ,  $P_{\text{women}} \geq 0.05$ ). Within each of the three categories, the loci were sorted by increasing  $P$  value of sex-based heterogeneity in the effect betas.

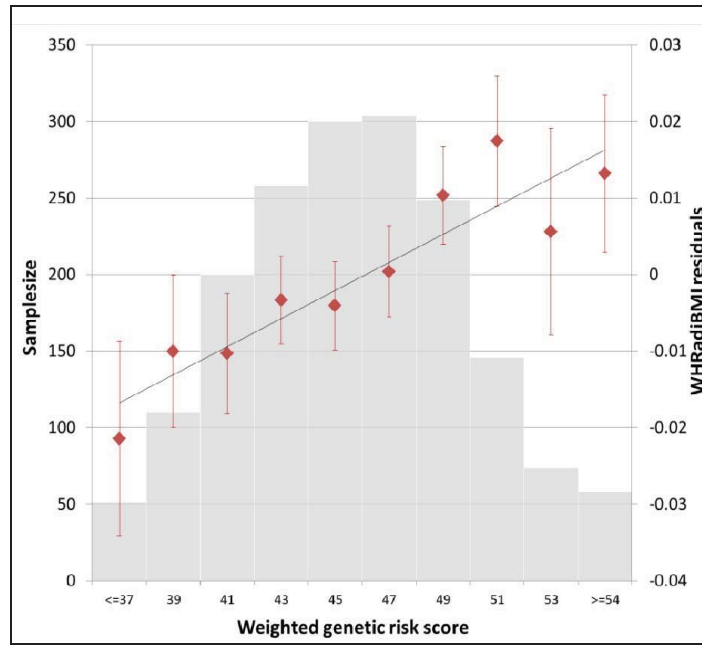

**Supplementary Figure 7.** Standardized phenotypic variance components for six waist-related traits in men (M) and women (W) from the Swedish Twin Registry ( $N = 11,875$ ). The ACE models are decomposed into additive genetic components (A) shown in black, common environmental components (C) in gray, and non-shared environmental components (E) in white. WHR refers to waist-hip ratio and BMI refers to body mass index. When the A component is different in men and women with  $P < 0.05$  for a given trait, it is marked with an asterisk.

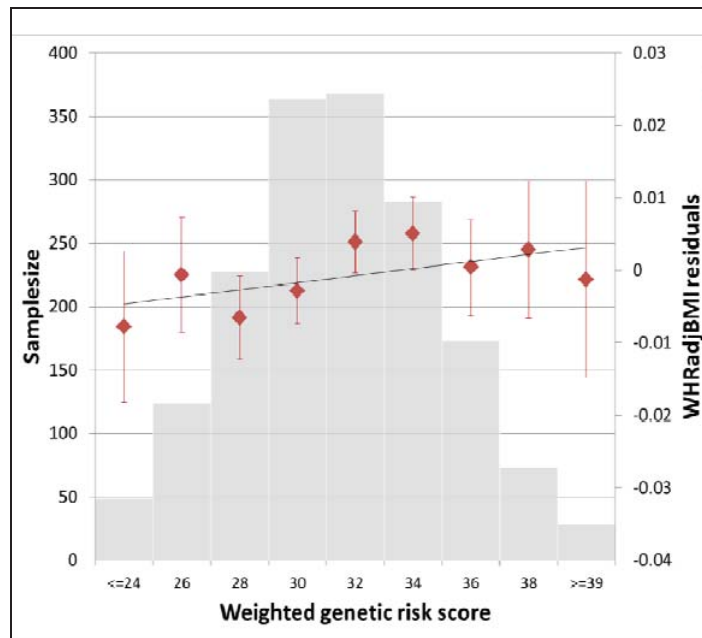

**Supplementary Figure 8.** Cumulative genetic risk scores (GRS) for central adiposity are shown as applied to the KORA study cohort: **(A)** all subjects ( $N = 3,440$ ,  $P_{\text{trend}} = 6.7 \times 10^{-4}$ ), **(B)** only women ( $N = 1,750$ ,  $P_{\text{trend}} = 1.0 \times 10^{-11}$ ), and **(C)** only men ( $N = 1,690$ ,  $P_{\text{trend}} = 0.02$ ). Each GRS illustrates the joint effect of the WHR-increasing alleles of the 49 identified variants from **Table 1** weighted by the relative effect sizes from the applicable sex-combined or sex-specific meta-analysis. The mean WHR residual and 95% confidence interval are plotted for each GRS category (red dots). The histograms show each GRS is normally distributed in KORA (gray bars).

(B)

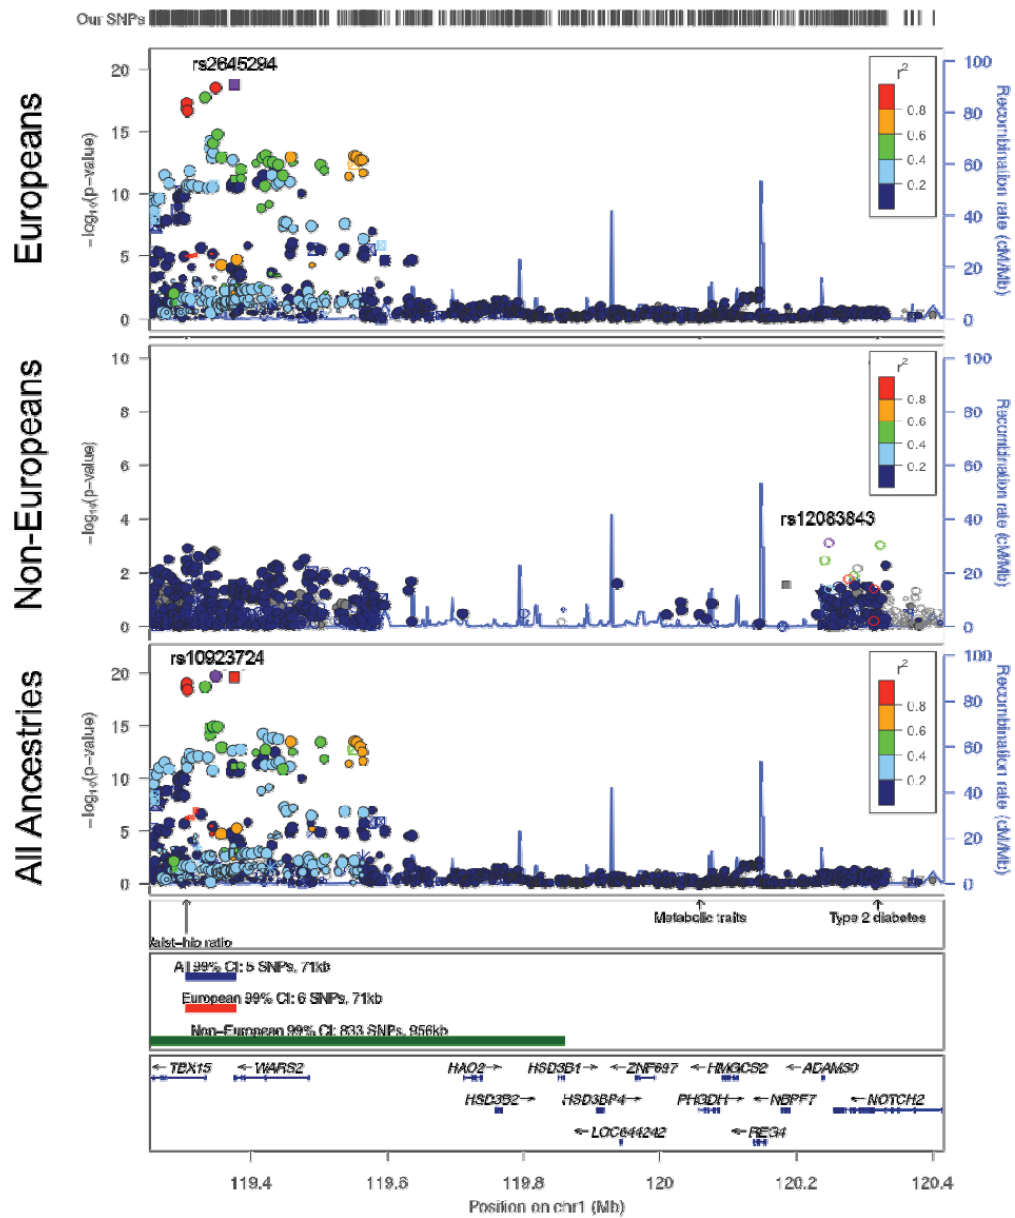

(C)

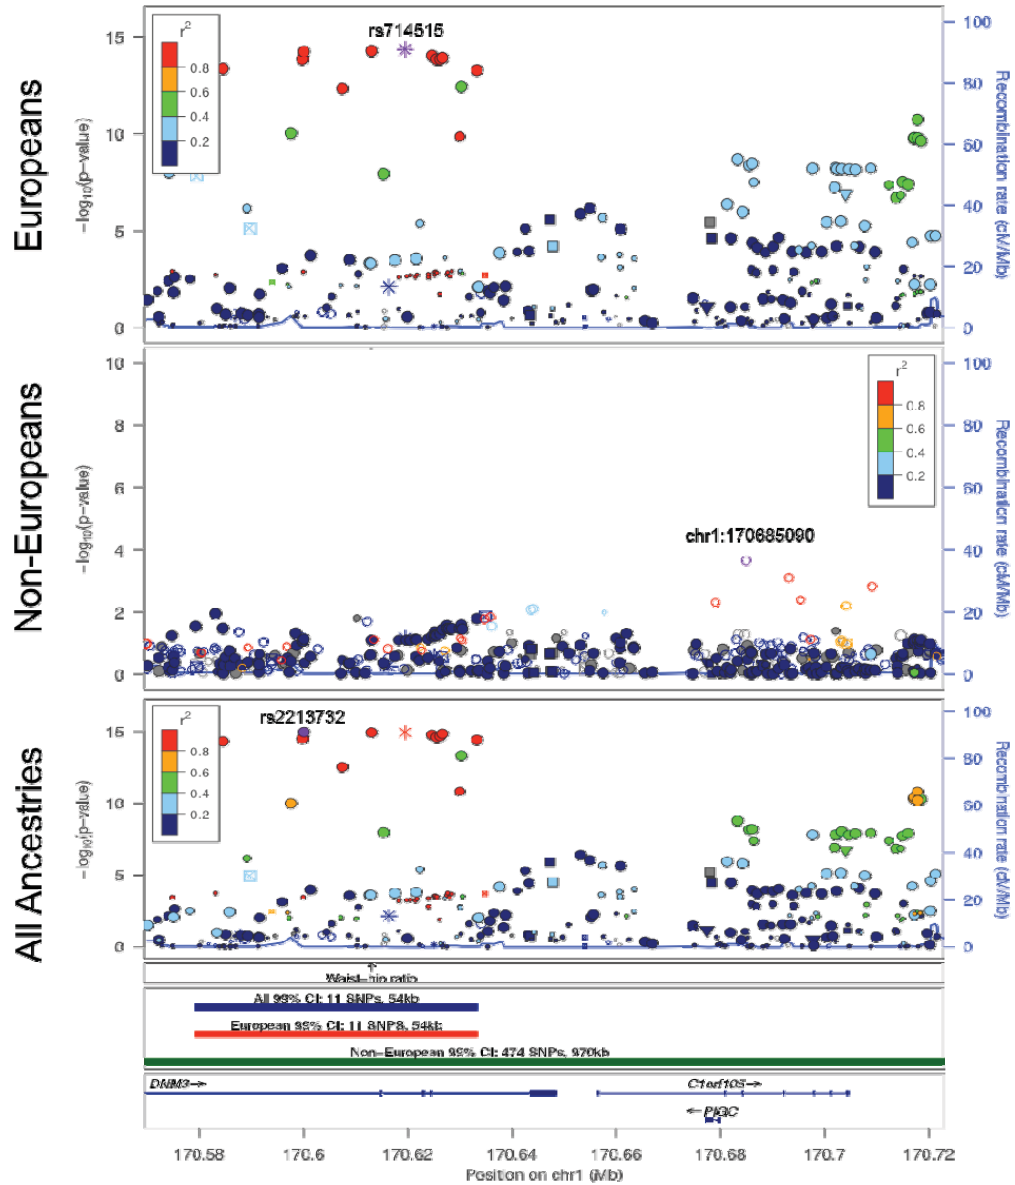

**Supplementary Figure 9.** Regional association plots of 17 waist-hip ratio (WHR) adjusted for body mass index (BMI) signals from **Table 1** covered with fine-mapping density on the Metabochip. Plots are arranged in chromosomal order.

# **TBX15-WARS2 (WHR adjusted for BMI, Sex-Combined)**

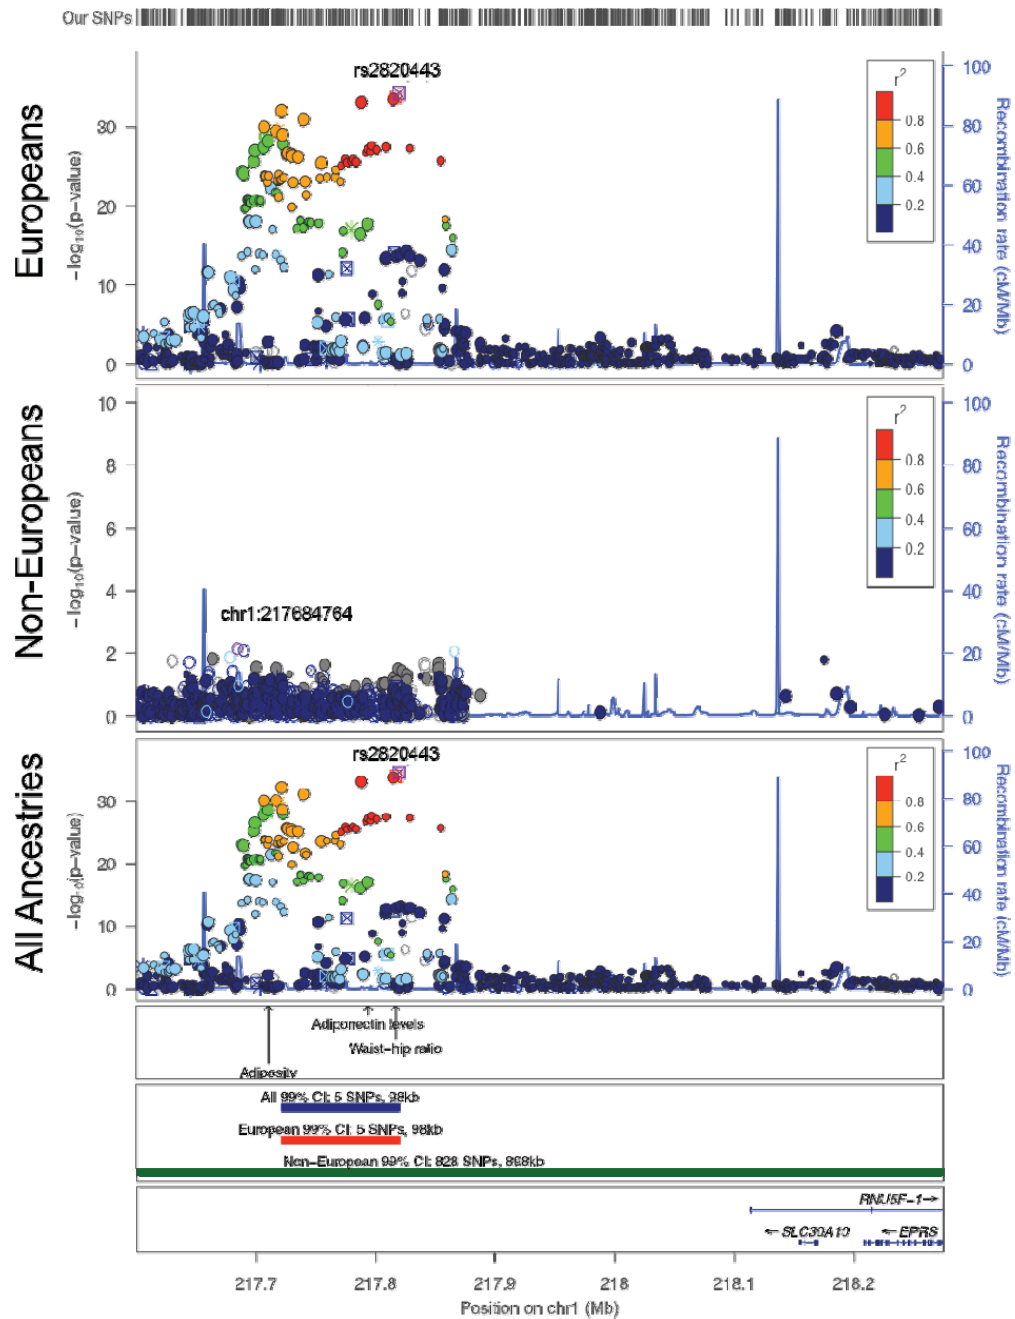

# *DNM3-PIGC* (WHR adjusted for BMI, Sex-Combined)

# LYPLAL1 (WHR.adjusted for BMI, Women)

# *GRB14-COBLL1* (WHR adjusted for BMI, Women)

# *PBRM1* (WHR adjusted for BMI, Sex-Combined)

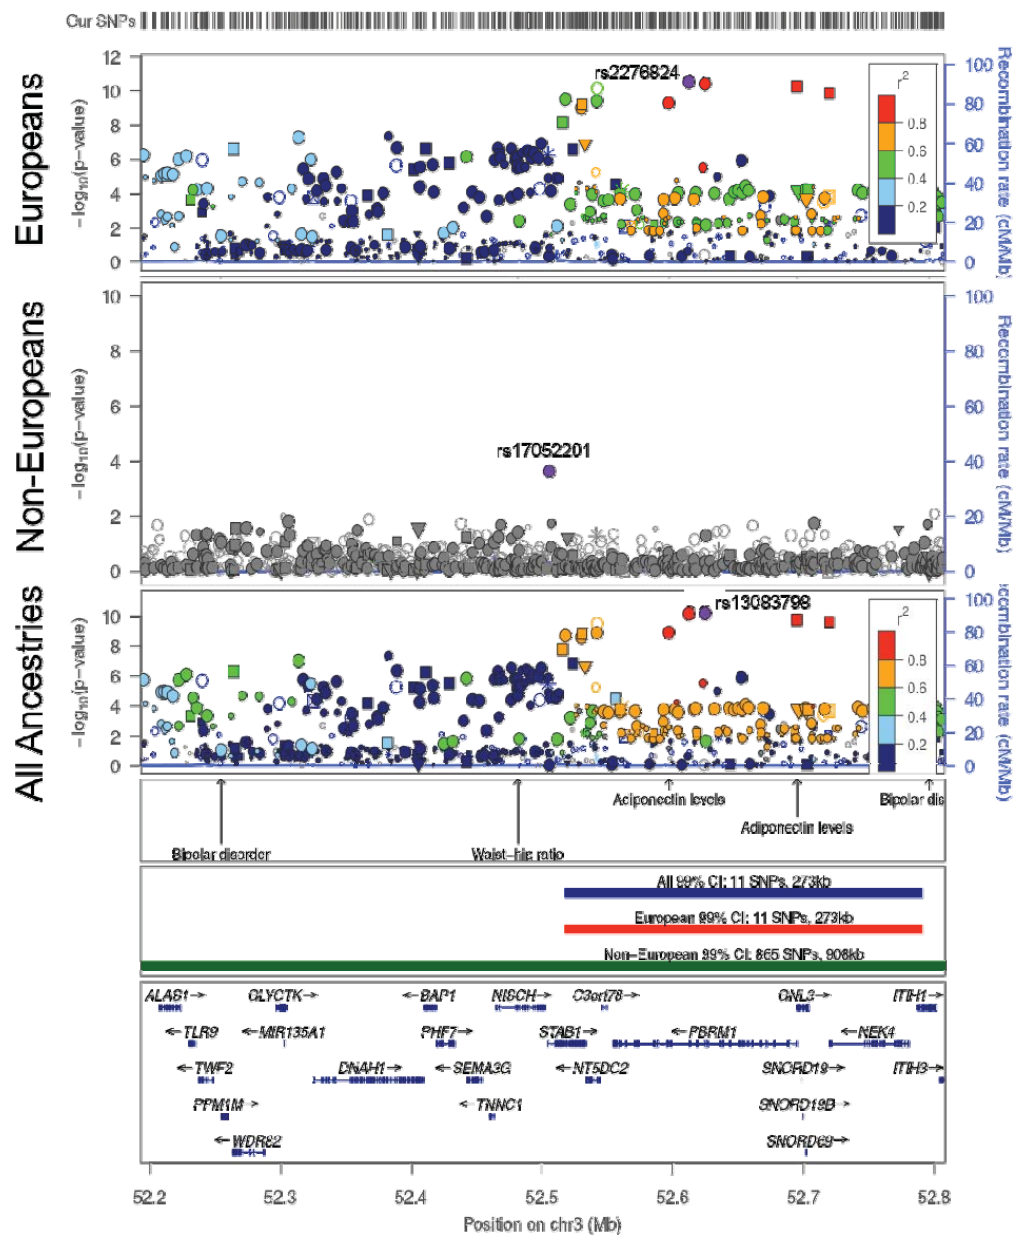

Figure 1 displays the genetic architecture of the waist-hip ratio locus on chromosome 3, showing the results of a genome-wide association study (GWAS) across different populations and recombination rates.

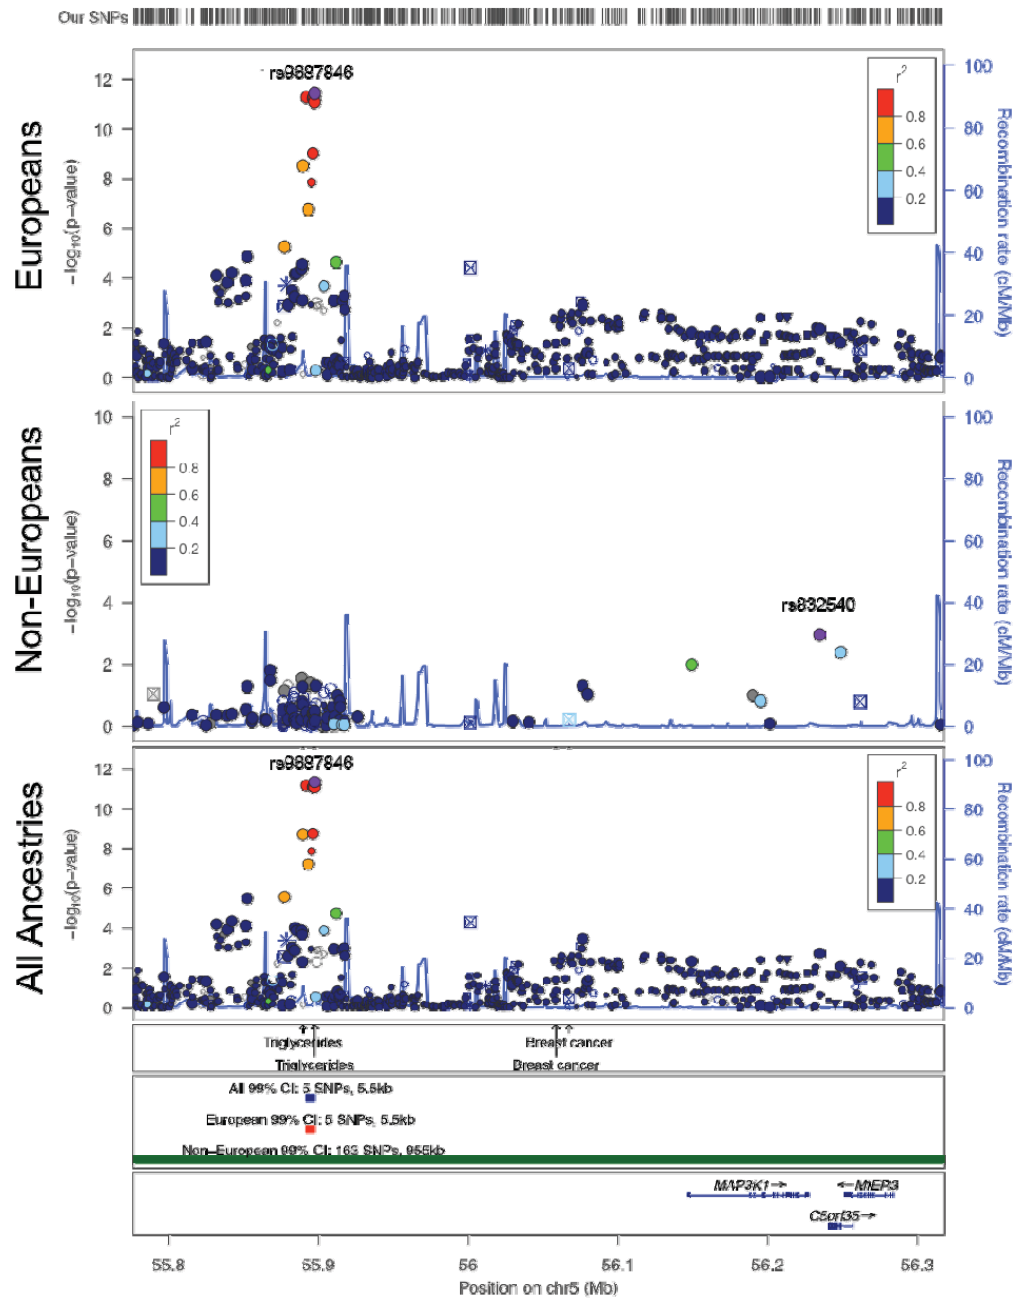

The figure consists of four vertically stacked panels sharing a common x-axis representing the Position on chr3 (Mb), ranging from 64.67 to 64.7.

The top three panels show the  $-\log_{10}(p\text{-value})$  for different populations, with the right y-axis representing the Recombination rate (cM/Mb). The legend indicates the  $r^2$  values for the SNPs, ranging from 0.2 (dark blue) to 0.8 (red).

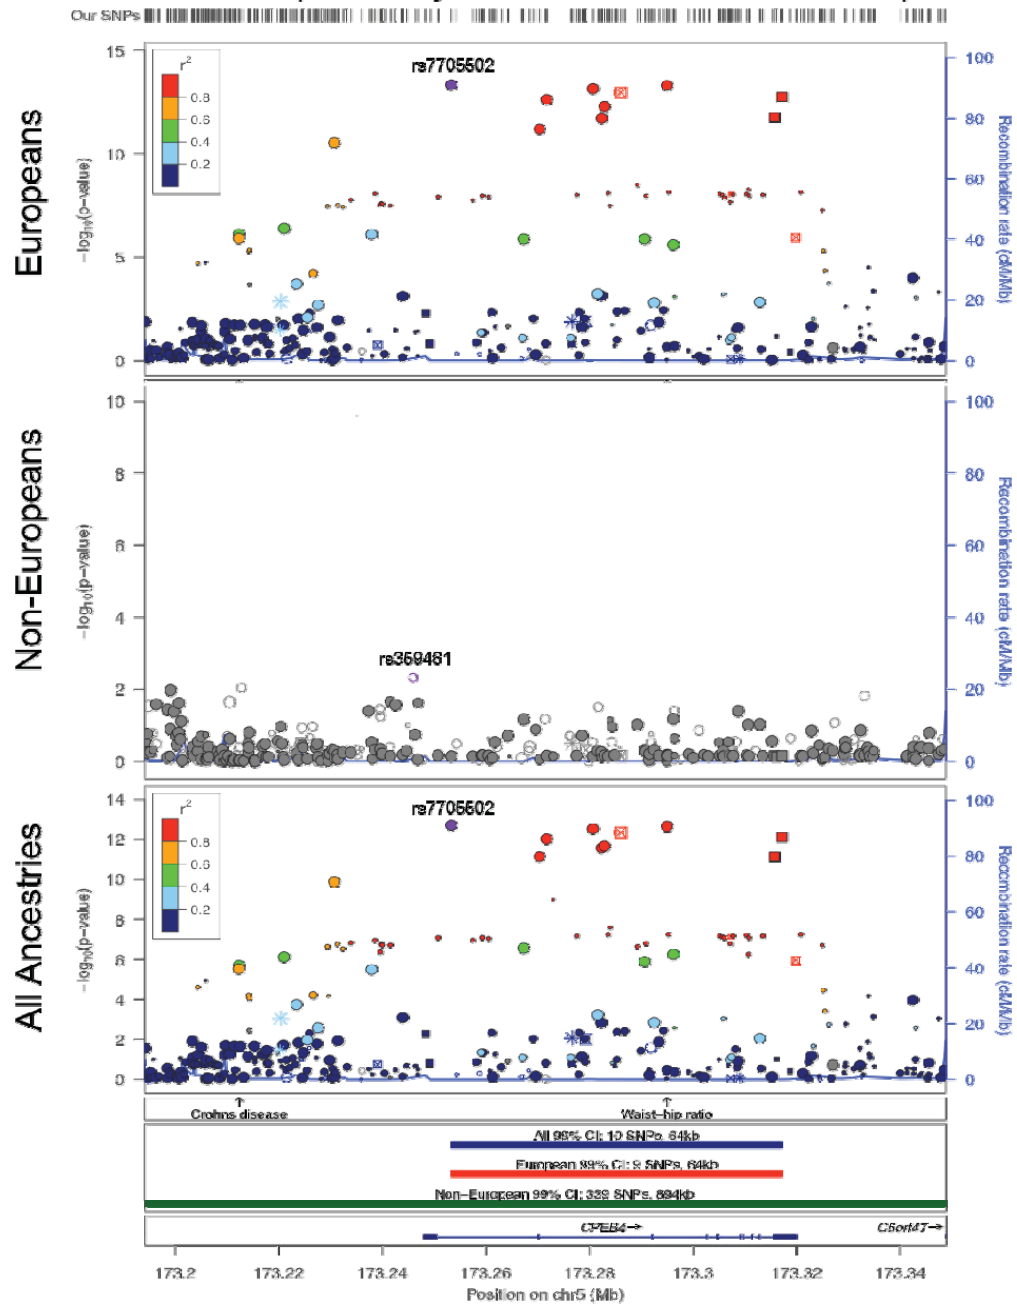

- Top Panel (European):** Shows the results for the European population. The lead SNP is rs2371767, located at approximately 64.685 Mb. The recombination rate is high in this region, peaking at approximately 100 cM/Mb.
- Middle Panel (African):** Shows the results for the African population. The lead SNP is rs2059092, located at approximately 64.685 Mb. The recombination rate is lower than in the European population, peaking at approximately 40 cM/Mb.
- Bottom Panel (Non-European):** Shows the results for the Non-European population. The lead SNP is rs2371767, located at approximately 64.685 Mb. The recombination rate is high in this region, peaking at approximately 100 cM/Mb.

The bottom panel displays the recombination rates and gene annotations for the region. The genes shown are ADAMTS1-AS2 and MIR549AN. The recombination rate is high in this region, peaking at approximately 100 cM/Mb.

**Supplementary Figure 10.** Regulatory element overlap with WHRadjBMI-associated loci. **A.** Five variants ~77 kb upstream of the first *CALCLR* transcription start site overlap regions with genomic evidence of regulatory activity in endothelial cells. **B.** Five variants, including rs8817452, in a 1.1kb region (box) ~250 kb downstream of the first *LEKR1* transcription start site overlap evidence of active enhancer activity in adipose nuclei. Signal enrichment tracks are from the ENCODE Integrative Analysis and the Roadmap Epigenomics track hubs on the UCSC Genome browser. Transcripts are from the GENCODE basic annotation.

## Supplementary Note

### Candidate genes at new loci for WHRadjBMI achieving genome-wide significance

1. **Chromosome 1q21.3-q22: *DCST2***, DC-STAMP domain containing 2

*DCST2* encodes dendritic cell-specific transmembrane protein domain containing 2, a multimembrane spanning protein that contains a domain similar to that found in dendritic cells. DC-STAMP proteins have been implicated in skewing hematopoietic differentiation of bone marrow cells toward the myeloid lineage, and in cell fusion during osteoclastogenesis and giant cell formation<sup>1</sup>. A nearby gene is ***ZBTB7B***, zinc finger and BTB domain containing 7B, also known as ThPOK, which encodes a zinc finger transcription factor that is critical to CD4+ T cell development in CD4/CD8 lineage commitment, and suppresses CD8-lineage gene expression<sup>2,3</sup>. *ZBTB7B* has been shown to function as a transcriptional repressor of fibronectin and alpha1 collagen genes<sup>4</sup>.

2. **Chromosome 1q24.2: *GORAB***, golgin, RAB6-interacting

*GORAB* encodes a member of the golgin family, and is a coiled-coil protein localized to the Golgi apparatus. This protein family may play a role in Rab6-regulated membrane-tethering events<sup>5</sup>.

3. **Chromosome 2p14: *MEIS1***, Meis homeobox 1

The lead WHRadjBMI-associated SNP is located ~500 kb from *MEIS1*, which encodes a transcription factor that is a member of the three-amino-acid loop extension family of homeobox-containing proteins. Meis1 is essential for hematopoiesis and vascular patterning in the mouse embryo<sup>6</sup> and regulates vascular development in zebrafish<sup>7</sup>. Dysregulation of *MEIS1* expression has been linked to a variety of leukemias<sup>8-10</sup>. The lead SNP is also <400 kb from *miR4778*.

4. **Chromosome 2q32.1: *CALCRL***, calcitonin receptor-like

*CALCRL* encodes calcitonin receptor-like protein receptor, involved in G-protein coupled receptor-like signaling. Calcitonin receptor-like receptor, CRLR, along with receptor activity-modifying protein-2, RAMP2, are receptors for adrenomedullin. Adrenomedullin and CRLR/RAMP2 levels were increased in epididymal, mesenteric, and retroperitoneal adipose tissue in rats fed a high-fat diet compared to rats fed a normal diet<sup>11</sup>. *CRLR* mRNA levels were decreased in epicardial white adipose tissue compared to subcutaneous white adipose tissue from human biopsies<sup>12</sup>. A nearby gene, *TFPI*, encodes a protease inhibitor that regulates the tissue factor (TF)-dependent pathway of blood coagulation. The encoded protein is predominantly found in the vascular endothelium and plasma in both free forms and in complexes with plasma lipoproteins.

5. **Chromosome 3q22.1: *PLXND1***, plexin D1

*PLXND1* encodes plexin D1 protein, a co-receptor for semaphorin proteins<sup>13</sup>. *Plxnd1* is expressed in cells from the central nervous system and vascular endothelium in mouse embryos<sup>14</sup>. Plexin D1 plays

a role in vascular patterning; *plxnd1*-deficient zebrafish embryos show defects in segmental artery development such as premature and ectopic sprouting and improper blood vessel branching<sup>15</sup>. Semaphorin-plexinD1 signaling antagonizes the proangiogenic activity of vascular endothelial growth factor, VEGF<sup>16</sup>.

6. **Chromosome 3q25.31: *LEKR1***, leucine, glutamate and lysine rich 1 protein

*LEKR1* encodes leucine, glutamate and lysine rich 1 protein with unknown function. The lead WHRadjBMI-associated SNP is also located near ***CCNL1***, encoding cyclin L1, and two uncharacterized noncoding RNAs, LINC00880 and LINC00881. Also nearby, ***TIPARP*** encodes a poly(ADP-ribose) polymerase superfamily member, which catalyzes the transfer of multiple ADP-ribose groups from nicotinamide-adenine dinucleotide (NAD) onto protein targets, and ***VEPH1*** encodes ventricular zone expressed PH domain-containing 1.

7. **Chromosome 4q12: *NMU***, neuromedin U

*NMU* encodes neuromedin U, a highly conserved neuropeptide. NMU is found at highest levels in the gastrointestinal tract and pituitary, and has been implicated in the regulation of smooth muscle contraction, blood pressure and local blood flow, ion transport in the gut, stress responses, cancer, gastric acid secretion, and feeding behavior<sup>17</sup>. *Nmu* knockout mice are hyperphagic and obese<sup>18</sup>. Rare coding variants in NMU have been found to be associated with obesity<sup>19</sup>.

8. **Chromosome 4q22.1: *FAM13A***, family with sequence similarity 13, member A

*FAM13A* has a putative role in signal transduction, however is poorly described. SNPs in this gene region were found to be associated with chronic obstructive pulmonary disease and lung function<sup>20,21</sup>. Other nearby genes include ***HERC3***, ***NAP1L5***, ***PIGY*** (phosphatidylinositol-glycan biosynthesis class Y protein), and ***TIGD2***.

9. **Chromosome 4q28.1: *SPATA5***, spermatogenesis associated 5 – ***FGF2***, fibroblast growth factor 2

*SPATA5* belongs to the AAA ATPase family and AFG2 subfamily, and may be involved in mitochondrial transformation during spermatogenesis. SNPs at *SPATA5* have been associated with alopecia areata<sup>22</sup>. Other nearby genes include ***FGF2***, ***NUDT6***, and ***SPRY1***. FGF2 enhanced vascularization for human adipose tissue engineering<sup>23</sup>. *NUDT6* (nudix-type motif 6) is an antisense gene to *FGF2* that showed associations with fat deposition related traits in pigs<sup>24</sup>. Conditional *Spry1* (sprouty homolog 1) expression in mouse adipose tissue protected against high-fat diet-induced obesity, bone loss, and metabolic dysfunction<sup>25</sup>.

10. **Chromosome 5q11.2: *MAP3K1***, mitogen-activated protein kinase kinase kinase 1, E3 ubiquitin protein ligase

The lead SNP is located within the intron of an uncharacterized transcript **AC022431**. Located 250 kb away, *MAP3K1*, also known as *MEKK1*, encodes a protein in the MAPK group of serine/threonine protein kinases. The protein contains a PHD plant homeodomain that exhibits E3 ubiquitin ligase activity toward ERK1/2<sup>26</sup>. MAP3K1 also activates the JNK signaling pathway and plays a role in apoptosis<sup>27</sup> and wound healing<sup>28</sup>. Along with IL-1beta, MAP3K1 inhibited basal and membrane depolarization and cAMP-induced transcription of the insulin gene in a hamster beta cell line<sup>29</sup>.

11. **Chromosome 5q35.2: *FGFR4***, fibroblast growth factor receptor 4

*FGFR4* is a member of the receptor tyrosine kinase family<sup>30</sup>. *FGFR4* is expressed mainly in lung, kidney, pancreas, spleen and developing muscle<sup>31</sup>. *FGFR4*-deficient mice on a normal diet displayed increased mass of white adipose tissue, hyperlipidemia, glucose intolerance, insulin resistance and hypercholesterolemia<sup>32</sup>.

12. **Chromosome 6p21.32: *BTNL2***, butyrophilin-like 2 (MHC class II associated)

Located 30 kb from the HLA cluster, *BTNL2* is an MHC class II gene-linked butyrophilin family member that inhibits T-cell activation<sup>33</sup>. Variants in *BTNL2* are associated with inflammatory diseases<sup>34,35</sup>. Other nearby genes include *HLA-DRA*, *HLA-DRB5*, *HLA-DRB1*, *HLA-DRB6*, *HLA-DRB1*, *HLA-DQA1*, *HLA-DQB1*. These HLA genes belong to the HLA class II proteins, which are expressed in antigen presenting cells, such as B lymphocytes, macrophages, and dendritic cells.

13. **Chromosome 6p21.31: *HMGA1***, high mobility group AT-hook 1

*HMGA1* encodes a protein that binds to the minor groove of stretches of A-T-rich DNA<sup>36</sup>. *HMGA1* is a downstream nuclear target of the insulin receptor signaling pathway<sup>37</sup>, and *Hmga1* knockout mice showed decreased insulin receptor expression, impaired insulin signaling and reduced insulin secretion<sup>38</sup>.

14. **Chromosome 7p15.2: *HOXA11***, homeobox A11

There are 12 *HOXA* genes at this locus, as well as several antisense transcripts. *HOX* genes encode conserved transcription factors containing a homeodomain that regulate body and axis development and organogenesis<sup>39</sup>. *HOXA11* is necessary for female fertility and regulates embryonic uterine and endometrium development<sup>40,41</sup>. *HOXA11* mutations were found in individuals affected with the blood disease amegakaryocytic thrombocytopenia and the skeletal defect radio-ulnar synostosis<sup>42</sup>.

15. **Chromosome 8p21.2: *NKX2-6***, NK2 homeobox 6

*NKX2-6* encodes a homeobox-containing protein that is a homolog of *Drosophila tinman*<sup>43</sup>. At early stages of mouse embryogenesis, *NKX2-6* is expressed in the pharyngeal endoderm, developing gut endoderm, cardiac progenitors, and heart<sup>44,45</sup>. Nearby *NKX3-1* is also a homeobox gene that is involved in prostate epithelium development during embryogenesis<sup>46</sup> and is androgen-regulated<sup>47</sup>. *STC1* encodes a secreted, homodimeric glycoprotein that is expressed in a wide variety of tissues and

is upregulated by VEGFD. STC1 may play a role in the regulation of renal and intestinal calcium and phosphate transport, cell metabolism, and angiogenesis.

**16. Chromosome 8q13.3: *MSC*, musculin**

*MSC* encodes a basic helix-loop-helix transcription factor expressed in developing skeletal muscle<sup>48</sup> and mouse embryonic ectoderm<sup>49</sup>. *EYA1* encodes eyes absent homolog1, a protein phosphatase and co-activator for the transcription factor SIX1, which regulates skeletal muscle fiber-type and development<sup>50</sup>. Mutations in *EYA1* cause Branchio-oto-renal syndrome and Branchiootic syndrome, which are characterized by hearing loss, branchial arch defects and renal abnormalities<sup>51</sup>. EYA protein phosphatase activity promotes angiogenesis<sup>52</sup>.

**17. Chromosome 9q31.1: *ABCA1*, ATP-binding cassette, sub-family A (ABC1), member 1**

This gene encodes an ATP-binding cassette transporter. Mutations in *ABCA1* have been found to be associated with Tangier's disease and familial high-density lipoprotein deficiency<sup>53</sup>. Adipose tissue abundantly expresses *ABCA1*, and adipose tissue *ABCA1*-dependent cholesterol efflux and nascent HDL particle formation contribute to systemic HDL biogenesis<sup>54</sup>.

**18. Chromosome 10q24.32: *SFXN2*, sideroflexin 2**

*SFXN2* encodes a mitochondrial transmembrane protein that may facilitate transport of pyridoxine or enzyme cofactors involved in heme synthesis into the mitochondria. The gene is widely expressed, and is expressed at particularly high levels in adult kidney and liver<sup>55</sup>. *Sfxn2* was found upregulated in pancreatic islets from streptozotocin-induced diabetic rats compared to normal rats<sup>56</sup>.

**19. Chromosome 11q13.1: *MACROD1*, MACRO domain containing 1, *VEGFB*, vascular endothelial growth factor B**

Macrodomains are known to bind ADP-ribose derivatives<sup>57</sup>. Also known as LRP16, *MACROD1* was found to play a role in estrogen signaling by interacting with estrogen receptor alpha and enhancing the receptor's transcriptional activity<sup>58</sup>. It has also been found to bind to the androgen receptor via its macro domain and amplifies the transactivation of androgen receptor in response to androgen<sup>59</sup>. LRP16 regulated insulin content and glucose-stimulated insulin secretion in MIN6 cells, and overexpression of this gene protected MIN6 cells from fatty acid-induced apoptosis<sup>60</sup>. Diabetic db/db *Vegfb* knockout mice had ectopic lipid deposition, increased muscle glucose uptake and maintained normoglycemia, and treatment of db/db mice with a VEGF-B antibody enhanced glucose tolerance, preserved pancreatic islet architecture, improved  $\beta$ -cell function and improved dyslipidemia<sup>61</sup>. The index SNP is located ~6 kb from *FLRT1*, fibronectin leucine rich transmembrane protein 1, involved in cell adhesion and fibroblast growth factor mediated signaling<sup>62</sup>.

20. **Chromosome 12q24.31: *CCDC92***, coiled-coil domain containing 92 protein

The closest genes to the index variant are not obvious candidate genes. *CCDC92* encodes a protein with unknown function that was found to be upregulated in human B lymphoblastoid cells treated with a polychlorinated biphenyl pollutant<sup>63</sup>. *DNAH10* encodes dynein, axonemal, heavy chain 10, which may play a role in cilia or flagella. *ZNF664* encodes zinc finger protein 664; coding variants in *ZNF664* have been implicated in myopia<sup>64</sup>.

21. **Chromosome 15q13.3: *KLF13***, Kruppel-like factor 13

*KLF13* encodes Kruppel-like factor 13, which belongs to the Sp1-like family of transcription factors that contain 3 C-terminal zinc finger DNA-binding domains, and bind to GC-rich sequences<sup>65</sup>. *KLF13* is a regulator of heart development<sup>66</sup>, and was also found to bind and repress the low density lipoprotein receptor promoter<sup>67</sup>. A nearby gene, *OTUD7A*, belongs to a deubiquitinating enzyme subfamily characterized by an ovarian tumor (OTU) domain. This gene encodes a protease that cleaves ubiquitin linkages.

22. **Chromosome 15q21.3: *RFX7***, regulatory factor X, 7

*RFX7* encodes a member of the regulatory factor X family of transcription factors. It is a winged-helix transcription factor and contains a well-conserved RFX DNA binding domain. It has high ubiquitous expression, particularly in brain<sup>68</sup>. *TEX9*, encoding testis-expressed sequence 9, is poorly described. Another nearby gene, *NEDD4*, encodes neural precursor cell expressed, developmentally down-regulated 4, an E3 ligase. Overexpression of *Nedd4* suppressed BMP-induced osteoblast transdifferentiation process of mouse premyoblast C2C12 cells, and *NEDD4* was also found to be an important modulator of phospho-Smad1 in both BMP-2 and TGF- $\beta$ 1 action<sup>69</sup>.

23. **Chromosome 15q22.31: *SMAD6***, SMAD family member 6

*SMAD6* belongs to the SMAD family of proteins, which are related to *Drosophila* 'mother's against decapentaplegic' and *C. elegans* Sma. SMAD proteins are signal transducers of the TGF- $\beta$  superfamily and are involved in cell growth, morphogenesis, development and immune responses<sup>70</sup>. *SMAD6* inhibits the Bone morphogenetic protein/Smad1 signaling pathway<sup>71</sup>. 3T3-F442A mouse pre-adipocytes overexpressing *Smad6* show increased TGF- $\beta$  signaling and decreased adipocyte differentiation<sup>72</sup>.

24. **Chromosome 16q23.3: *CMIP***, c-MAF inducing protein

This gene encodes C-maf inducing protein, which interacts with phosphatidylinositol 3-kinase complex and plays a role in ERK signaling<sup>73</sup>. *CMIP* is expressed in peripheral blood mononuclear cells, kidney, fetal liver, and adult brain and liver<sup>74</sup>. A nearby gene, *PLCG2*, encodes phospholipase C, gamma 2 (phosphatidylinositol-specific), which hydrolyzes phosphatidyl inositol 4,5-bisphosphate (PIP<sub>2</sub>) to inositol-1,4,5-trisphosphate (IP<sub>3</sub>), resulting in an increase in intracellular calcium levels<sup>75</sup>.

25. **Chromosome 17p11.2: *PEMT***, phosphatidylethanolamine N-methyltransferase

This gene encodes a liver enzyme that converts phosphatidylethanolamine to the phospholipid phosphatidylcholine by methylation in the liver. The protein localizes to the endoplasmic reticulum and mitochondria-associated membranes. *Pemt* knockout mice on a high fat diet show adipocyte hypotrophy<sup>76</sup>. *Pemt* mRNA and protein increase upon adipocyte differentiation in 3T3-L1 cells<sup>77</sup>.

26. **Chromosome 17q24.3: *KCNJ2***, potassium inwardly-rectifying channel, subfamily J, member 2

Inwardly rectifying K<sup>+</sup> channels control the resting K<sup>+</sup> conductance and stabilize the resting potential in many cells<sup>78</sup>. *KCNJ2* was upregulated during myoblast differentiation into skeletal muscle<sup>79</sup> and was expressed in smooth muscle<sup>80</sup> and cardiomyocytes<sup>81</sup>.

27. **Chromosome 18q21.33: *BCL2***, B-cell CLL/lymphoma 2

B-cell CLL/lymphoma 2 encodes an anti-apoptotic protein that binds the BH3 domain of pro-apoptotic factors and regulates permeabilization of the outer mitochondrial membrane, a critical step in apoptosis<sup>82,83</sup>. *Bcl2* was upregulated and apoptosis was reduced in rat pancreatic beta-cells treated with leptin<sup>84</sup>.

28. **Chromosome 19p13.11: *JUND***, jun D proto-oncogene

JUND is a component of the Activating protein 1 transcription factor; AP-1 is a dimeric transcription factor with basic leucine zipper domains<sup>85</sup>. JunD dimerizes with DeltaFosB and binds to the *IL-11* gene promoter. Suppression of osteoblast differentiation by aging involved decreased JunD binding to the *IL-11* promoter and reduced *IL-11* transcription<sup>86</sup>. IL-11 inhibits the accumulation of adipose in human long-term bone marrow culture stromal layers<sup>87</sup>. Other nearby genes include ***KIAA1683***, ***LSM4***, ***PIK3R2***, ***PDE4C***, and ***miR3188***.

29. **Chromosome 19q13.11: *CEBPA***, CCAAT/enhancer binding protein alpha

C/EBP alpha is a basic leucine zipper transcription factor that is highly expressed in liver and adipose tissue, and is required for differentiation of white adipose tissue<sup>88</sup>. *C/ebp alpha* knockout mice have defects in gluconeogenesis, are hypoglycemic, and die shortly after birth<sup>89</sup>. Additionally, C/EBP alpha also binds to the leptin promoter, a gene that plays an important role in body weight homeostasis<sup>90</sup>. Other nearby genes include ***C/EBPG***, encoding C/EBP gamma, which forms heterodimers with C/EBP beta<sup>91</sup>, and ***PEPD***, encoding peptidase D.

30. **Chromosome 20p12.3: *BMP2***, bone morphogenetic protein 2

*BMP2* belongs to the transforming growth factor beta (TGF- $\beta$ ) superfamily of genes<sup>92</sup>. BMPs signal through transmembrane serine/threonine kinase receptors and stimulate Smad, MAPK and Akt signaling pathways<sup>93</sup>. High levels of BMP2 induce chondrogenesis or osteogenesis, while low levels of BMP2 promote adipogenesis<sup>94</sup>. BMP2 stimulates commitment of C3H10T1/2 pluripotent stem cells into

adipocytes<sup>95</sup>. BMP2, along with IGF-1, induces differentiation of adipose-derived mesenchymal stem cells into cartilage cells<sup>96</sup>.

31. **Chromosome 20q11.22: *GDF5***, growth differentiation factor 5

*GDF5* is a member of the bone morphogenetic protein BMP family and the transforming growth factor-beta superfamily<sup>97</sup>. *GDF5* promoted osteogenic differentiation of rat fat-derived stromal cells and may promote angiogenic activity of stromal cells by increasing vascular endothelial growth factor gene expression in vitro<sup>98</sup>. *GDF5* also induced chondrogenesis in rat adipose-derived stem cells<sup>99</sup>. Human mesenchymal stem cells that overexpressed *GDF5* displayed osteogenic differentiation<sup>100</sup>. ***UQCC*** is a nearby gene, which encodes ubiquinol-cytochrome c reductase complex chaperone, a ZIC-binding protein repressed by basic fibroblast growth factor<sup>101</sup>.

32. **Chromosome 20q13.12: *EYA2***, eyes absent homolog 2

This gene encodes a member of the eyes absent, *EYA*, family of proteins. *EYA2* is a transcriptional co-activator and protein phosphatase. *Eya2* acts synergistically with both *Dach2* and *Six1* to regulate myogenic differentiation and development<sup>102</sup>. *Eya2* also prevents adverse cardiac remodeling under pressure overload<sup>103</sup>. Nearby, ***SLC2A10*** encodes solute carrier family 2 (facilitated glucose transporter) member 10.

33. **Chromosome 7p15.2: *SNX10***, sorting nexin 10

*SNX10* encodes a nexin family protein involved in intracellular trafficking. *SNX10* has been shown to cause osteopetrosis, a rare disorder resulting from osteoclast dysfunction<sup>104</sup>, and to regulate ciliogenesis<sup>105</sup> and endosome homeostasis<sup>106</sup>.

### Candidate genes at new loci for 5 additional waist and hip traits

1. **Chromosome 1q44: *OR2W5*** olfactory receptor family 2, subfamily W, member 5 and ***NLRP3***, NLR family, pyrin domain containing 3

*OR2W5* encodes an olfactory receptor. *NLRP3* regulates inflammation, immune response, and apoptosis, and is associated with several inflammatory and autoimmune disorders. Other variants near *NLRP3* are associated with C-reactive protein levels<sup>107</sup>. *NLRP3*-containing inflammasome and proinflammatory T cell populations in adipose tissue contribute to inflammation and in insulin resistance<sup>108</sup>. Other nearby genes include ***OR2C3***, encoding an olfactory receptor, and ***GCSAML-AS1*** antisense non-coding RNA.

2. **Chromosome 2p25: *SOX11***, SRY (sex determining region Y)-box 11

This intronless gene encodes a member of the SOX (SRY-related HMG-box) family of transcription factors involved in the regulation of embryonic development and in the determination of the cell fate. *SOX11* plays a role in the embryonic development of the central nervous system (CNS) and is

expressed in the adult immature neuron. Knockdown of *SOX11* with siRNA decreased the proliferation and osteogenic differentiation potential of mesenchymal stem cells<sup>109</sup>. *SOX11* has tumor suppressor function in hematopoietic malignancies<sup>110</sup>, and prevents tumorigenesis of glioma initiating cells by inducing neuronal differentiation<sup>111</sup>.

3. **Chromosome 2q24.2: *ITGB6***, Integrin, beta 6

*ITGB6* encodes a heterodimeric cell surface receptor, which is absent from the normal epithelium but is expressed in wound-edge keratinocytes during re-epithelialization. *ITGB6* is involved in tumor growth and metastasis and may serve a protective role in re-epithelialization of diabetic wounds<sup>112</sup>. Other nearby genes encode *PLA2R1*, phospholipase A2 receptor, and *RBMS1*, a protein that binds single-stranded DNA and RNA.

4. **Chromosome 5q11.2: *ARL15***, ADP-ribosylation factor-like 15

*ARL15* encodes an ADP-ribosylation factor-like (ARL) protein. ARL proteins are small GTPases that regulate the affinity of ARLs for binding other proteins, lipids, or membranes<sup>113</sup>. *ARL15* is expressed in insulin-responsive tissues, including adipose tissue and skeletal muscle<sup>114</sup>. Other SNPs at *ARL15* have previously been associated with adiponectin levels<sup>114,115</sup>, HDL levels<sup>116</sup> and replicated CNVs in childhood obesity<sup>117</sup>.

5. **Chromosome 5q33.3: *CCNJL***, cyclin J-like

This gene encodes a protein that belongs to the cyclin family, cyclin J subfamily, which regulates cyclin dependent kinases<sup>118</sup>. A nearby gene is *FABP6*, encoding fatty acid binding protein 6, which binds fatty acids and is involved in fatty acid uptake, transport and metabolism<sup>119</sup>. *Fabp6* is necessary for absorption and transport of bile acids in mouse small intestine<sup>120</sup>. Other nearby genes include *PWWP2A*, encoding PWWP domain containing 2A; and *C1QTNF2*, encoding C1q and tumor necrosis factor related protein 2.

6. **Chromosome 6p25: *GMDS***, GDP-mannose 4,6-dehydratase

*GMDS* catalyzes the first step of GDP-fucose synthesis from GDP-mannose and can inhibit apoptosis in colon cancers<sup>121</sup>. Other nearby genes include *FOXC1* (forkhead box C1), *FOXQ1* (forkhead box Q1), *FOXF2* (forkhead box F2), all of which are DNA-binding proteins involved in cell growth, apoptosis, migration and differentiation<sup>122</sup>. *FOXQ1* is negatively regulated by Oct4 in adipose tissue stromal cells<sup>123</sup>.

7. **Chromosome 6p12.1: *KLHL31***, kelch-like 31

*KLHL31* regulates transcription in the MAPK/JNK pathway<sup>124</sup>. In chicken, *Klh31* was found to be highly expressed in the somite myotome, heart, and in differentiated myocardium and skeletal muscle<sup>125</sup>. Nearby gene *GCLC*, encodes the glutamate-cysteine ligase catalytic subunit, which plays a regulatory role in glutathione synthesis, and may play a role in growth and development<sup>126</sup>. Another

- nearby gene, **ELVOL**, encodes fatty acid elongase 5, which is involved in fatty acid synthesis and elongation. Increased expression of *Elvol* has been shown to restore glucose homeostasis and decrease insulin localization in hyperglycemic mice fed a high-fat diet<sup>127</sup>.
8. **Chromosome 7q22.3: SRPK2**, Serine/arginine-rich splicing factor protein kinase 2  
*SRPK2* encodes a non-small nuclear ribonucleoprotein particle that regulates the intracellular storage of splicing factors<sup>128,129</sup>. Knockdown of *SRPK2* by RNAi in HeLa cells demonstrated that this gene is essential for cell viability<sup>130</sup>. Nearby genes include **LHFPL3** (lipoma HMGIC fusion partner-like 3), **MLL5** (myeloid/lymphoid or mixed-lineage leukemia 5), which is suggested to have a role in chromatin remodeling and cellular growth suppression<sup>131</sup>, and several non-coding RNAs.
  9. **Chromosome 7q32: KLF14**, Kruppel-like factor 14  
*KLF14* encodes an imprinted developmental transcription factor exhibiting maternal allelic expression induced by TGF-beta. *KLF14* has been shown to be a master trans-regulator affecting multiple metabolic phenotypes<sup>132</sup>. Other nearby genes include **CPA4** (carboxypeptidase A4), **CPA2** (carboxypeptidase 2), **MEST** (mesoderm specific transcript homolog), and **COPG2** (coatamer protein complex, subunit gamma 2).
  10. **Chromosome 9q22.32: PTPDC1**, protein tyrosine phosphatase domain containing 1  
*PTPDC1* is a member of a protein family known to play roles in molecular signalling in a wide variety of biological processes<sup>133,134</sup>. Mouse *Ptpcd1* was suggested to play a role in centriole duplication and cytokinesis<sup>135</sup> and depletion has been shown to correlate with cilia elongation<sup>136</sup>. Nearby genes include **BARX1**, encoding BARX homeobox transcription factor, implicated in dentition and cleft lip syndrome<sup>137</sup>, and **ZNF169**, which encodes zinc finger protein 169 transcription factor. A near genome-wide significant association has been found between a nearby SNP (rs10993160,  $P = 5.5 \times 10^{-7}$ ) and BMI in East Asians<sup>138,139</sup>.
  11. **Chromosome 9q33-q34: C5**, complement component 5 (also known as **CPAMD4**)  
*C5* encodes the fifth component of complement, which plays an important role in host defense and inflammatory processes. Mutations in *C5* cause a propensity for severe recurrent infections. Complement component 5 contributes to poor disease outcome in humans and mice with pneumococcal meningitis<sup>140</sup>. Defects in this gene have also been linked to susceptibility to liver fibrosis and rheumatoid arthritis<sup>141</sup>. Other nearby genes include **PSMD5**, encoding 26S proteasome non-ATPase regulatory subunit 5, **FBXW2**, encoding F-box and WD repeat domain containing 2, and **TRAF1**, TNF receptor-associated factor 1.
  12. **Chromosome 11q13: MYEOV**, myeloma overexpressed  
*MYEOV*, encoding myeloma overexpressed (in a subset of t(11;14) positive multiple myelomas) has been implicated in multiple myeloma, as well as some other cancer types<sup>142</sup>. Nearby are members of

the fibroblast growth factor family **FGF19**, **FGF4** and **FGF3**. FGFs play important roles in multiple physiologic functions, including angiogenesis, mitogenesis, pattern formation, cellular differentiation, metabolic regulation, tissue repair, and oncogenesis. *FGF19* has been shown to activate an insulin-independent endocrine pathway that regulates hepatic protein and glycogen metabolism<sup>143</sup>. Other nearby genes include **CCND1** (cyclin D1) and **ORAOV1** (oral cancer overexpressed 1).

13. **Chromosome 11q21: *KIAA1731***

RNAi analyses suggest that *KIAA1731* encodes a centrosomal protein responsible for centriole formation/stability<sup>144</sup>. Other nearby genes include **TAF1D** (TATA box binding protein associated factor, RNA polymerase I), which plays a role in RNA polymerase I transcription<sup>145,146</sup>, **MED17** (mediator complex subunit 17), **C11orf54**, **C11orf54**, **SCARNA9** and **VSTM5**.

14. **Chromosome 11q22.1: *CNTN5*, contactin 5**

CNTN5 is a glycosylphosphatidylinositol (GPI)-anchored neuronal membrane protein that functions as a cell adhesion molecule. CNTN5 may play a role in the formation of axon connections in the developing nervous system<sup>147</sup>. Other nearby genes include **PGR**, encoding the progesterone receptor, and **TMEM133**, encoding transmembrane protein 133.

15. **Chromosome 13q31.3, *GPC6*, glypican 6**

*GPC6* is a member of a family of glycosylphosphatidylinositol-anchored heparan sulfate proteoglycans that are ubiquitously expressed in most fetal and adult tissues<sup>148</sup>. *GPC6* may influence cellular growth control and differentiation during development, and mutations in this gene have been shown to cause the rare skeletal dysplasia autosomal recessive generalized omodysplasia<sup>149</sup>.

16. **Chromosome 16p13.11: *PDXDC1*, pyridoxal-dependent decarboxylase domain containing 1**

PDXDC1 has been predicted to belong to the family of group II pyridoxal-dependent decarboxylases, which includes enzymes that decarboxylate glutamate, histidine, tyrosine and tryptophan<sup>150</sup>. Nearby gene **PLA2G10** (phospholipase A2, group X), is important for the breakdown of phospholipids and cholesterol into fatty acids<sup>151-154</sup>. Nearby gene **NTAN1** (N-terminal asparagine amidase) is an integral part of the N-end rule pathway; disruption of this pathway by knocking out the *Ubr1* gene resulted in mice with decreased body weight due to reduced skeletal muscle and adipose tissue<sup>155</sup>.

17. **Chromosome 16q12: *ZNF423*, zinc finger protein 423**

*ZNF423* encodes a zinc finger transcription factor that associates with RARalpha/RXRalpha nuclear receptor complex and is critical for retinoic acid-induced differentiation<sup>156</sup>. Delayed induction of preadipocyte transcription factor *ZNF423* in fibroblasts resulted in delayed adipogenesis<sup>157</sup>. A nearby gene, **CNEP1R1**, encoding CTD nuclear envelope phosphatase 1 regulatory subunit 1 is involved in the conversion of phosphatidic acid to diacylglycerols and may indirectly modulate the lipid

composition of nuclear and/or endoplasmic reticulum membranes and to regulate the production of lipid droplets and triacylglycerol<sup>158</sup>.

**18. Chromosome 17p13.3: *VPS53***, Vacuolar protein sorting 53 homolog (*S. cerevisiae*)

The *VPS53* protein is a component of the Golgi-associated retrograde protein complex, and is required to maintain the cycling of mannose 6-phosphate receptors between the trans-Golgi network and endosomes<sup>159,160</sup>. Other nearby genes include *FAM101B*, which encodes an actin regulator that stabilizes perinuclear actin filament bundles<sup>161</sup>.

**19. Chromosome 22q12.3: *HMGXB4***, high mobility group (HMG) box domain containing 4

*HMGXB4* encodes a DNA-binding protein responsible for repression of smooth muscle differentiation<sup>162</sup>. *HMGXB4* was previously named *HMG2L1*. Nearby genes include ***TOM1*** (target of myb1), ***HMOX1*** (heme oxygenase 1), ***ISX*** (intestine-specific homeobox), and ***MCM5*** (minichromosome maintenance complex component 5).

### **Comparison of ARIC and PIVUS as reference panels for GCTA**

To evaluate robustness of the GCTA results, we compared results using reference datasets from PIVUS (949 individuals with GWAS and Metabochip data) and ARIC (6,654 individuals with GWAS data, see Online Methods). Although the sets of SNPs selected by GCTA as independently associated with WHRadjBMI when using either reference dataset were very similar, with the estimated effect sizes in the joint association model highly correlated, a few differences were observed. Given that ARIC includes only GWAS genotype data, while our combined European ancestry meta-analysis includes both GWAS and Metabochip SNPs, any Metabochip SNP in the meta-analysis for which ARIC does not have genotype data was excluded from the GCTA search for independent association signals. These missing reference dataset genotypes explained the majority of the differences observed between the two analyses, including the larger number of loci with multiple association signals identified when estimating the correlation between the variants from PIVUS. In addition, a small number of discrepancies between the two analyses were the result of minor differences between the estimated association p-value for the joint model, with some SNPs reaching the  $P < 5 \times 10^{-8}$  threshold when using one dataset as reference, and therefore being selected by GCTA, while they did not reach that threshold when the correlation between SNPs was estimated from the other dataset.

In our particular setting, the choice of the preferable reference dataset is equivalent to the choice to give preference to the larger sample size provided by ARIC or to the larger SNP coverage obtained when using PIVUS. Given the observations, and in this particular case, we believe that we could achieve more insights into the genetic basis of body fat distribution by having a more dense coverage of the SNPs in our meta-analysis as that provided by PIVUS.

### **Genetic risk score comparison of high vs average genetic susceptibility**

We further used the genetic risk score to compare high genetic susceptibility with the average population. We used the linear regression estimates (see Main text) to calculate the difference in WHR units between the 95<sup>th</sup> percentile and the median of the sex-combined score (median = 46; 95<sup>th</sup> percentile = 53), the women-specific score (median = 45, 95<sup>th</sup> percentile = 52) and the men-specific score (median = 31, 95<sup>th</sup> percentile = 37).

The difference between individuals at the 50<sup>th</sup> percentile and at the 95<sup>th</sup> percentile genetic susceptibility risk score groups was 0.007 WHRadjBMI units overall, 0.014 in women and 0.004 in men. These results would imply, for example, that two people from the 50<sup>th</sup> and 95<sup>th</sup> percentiles of this risk score distribution and of the same sex, BMI, age, and HIP of 100 cm would exhibit a 0.7 cm difference in WC because of differences in their genotypes at these genetic variants (1.4 cm in women and 0.4 cm in men).

### **Directional consistency of effects in GWAS and Metabochip meta-analyses**

To investigate whether additional common variants may contribute to the phenotypic variance of WHRadjBMI, we compared directional consistency in sex-combined allelic effects between GWAS and Metabochip studies in the European-ancestry meta-analysis. We considered the distribution of association Z-scores from the Metabochip European ancestry sex-combined meta-analysis for WHRadjBMI, aligned to the trait-increasing allele from the GWA meta-analysis, at a subset of 1,343 independent WHRadjBMI "replication" variants on Metabochip<sup>163</sup> (CEU  $r^2 < 0.1$ ), excluding SNPs within 500 kb of the lead SNPs at identified WHRadjBMI loci. We counted the number of SNPs with the same direction of effect in both GWAs and Metabochip meta-analysis, and performed a one-sided binomial test for enrichment in concordance over that expected by chance (50%). For comparison, we repeated this process by obtaining a subset of 775 independent QT-interval "replication" variants<sup>163</sup> (CEU  $r^2 < 0.1$  with each other and >300 kb from any WHRadjBMI "replication" variants) not expected to be associated with anthropometric traits.

Among the 1,343 SNPs included on the Metabochip array based on nominal significance for WHRadjBMI<sup>163</sup>, we observed 797 (59%) directionally consistent SNPs compared to 671.5 expected by chance ( $P_{\text{binomial}} = 3.9 \times 10^{-12}$ ). The set of 775 SNPs selected for the array on the basis of QT interval<sup>163</sup> did not show such enrichment (372 SNPs, or 48%, compared to 388 expected,  $P_{\text{binomial}} = 0.87$ ). These results suggest that additional common WHRadjBMI variants may be found to be reproducible with larger samples.

### **Copy-number variant analysis**

To investigate the associations with CNVs, we used a list of SNPs that are known to be robust tags of CNVs due to high LD in European cohorts. Altogether four different CNV-tagging SNPs were genome-

wide significant in sex-combined analysis. In Supplementary table 13, all CNV-tagging SNP results are given from the 49 identified loci, which remained significant after multiple testing correction.

In the WHRadjBMI analysis, marker rs1294421 ( $p = 8.2 \times 10^{-18}$ ), which is in LD with CNVR2760.1 near *LY86* gene, was strongly associated. The same association was described in the previous GIANT analysis<sup>164</sup>. The same CNV tagging SNP was found to be genome-wide significant in the WHR analysis without BMI correction ( $p = 6.9 \times 10^{-14}$ ). Additionally we were able to detect statistically significant results after multiple testing correction at three additional loci: *SFMBT1* (WHRadjBMI: rs3733034 has  $P = 1.75 \times 10^{-6}$ ); *TNXB* (WHRadjBMI: rs1150753 has  $P = 4.45 \times 10^{-6}$ ), and *HMGXB4* (HIPadjBMI: rs1543302 has  $P = 1.13 \times 10^{-7}$ ).

### Comparison of results from MAGENTA, DEPICT and GRAIL analyses

*Overlap of gene sets for WHRadjBMI that were significantly prioritized by the MAGENTA and DEPICT pathway methods.* The Data-driven Enrichment-Prioritized Integration for Complex Traits (DEPICT) assesses for enrichment of 14,462 reconstituted gene sets, while MAGENTA assesses for enrichment of 3,216 gene sets. Consequently, there may be gene sets with different gene IDs that represent similar molecular functions or pathways (e.g. the BMP.Signaling.pathway in MAGENTA may represent similar biological pathways as the BMP4, BMP6, and BMPR1B protein complexes). To compare overlap of significantly enriched gene sets, we manually identified reconstituted DEPICT gene sets (false discovery rate (FDR) < 0.05) with gene set IDs similar to the enriched MAGENTA gene sets (FDR < 0.05). Among the 19 WHRadjBMI gene sets significantly prioritized by MAGENTA, 9 highly similar gene sets were significantly prioritized by DEPICT (Supplementary Table 21).

*Overlap of predicted genes for WHRadjBMI identified by both the GRAIL and DEPICT pathway methods.* The following 14 genes were significantly predicted by GRAIL (adjusted  $P < 0.05$ ) and DEPICT (FDR < 0.05): *TBX15*, *EYA2*, *HOXA11*, *GDF5*, *WNT4*, *BMP2*, *CITED2*, *SMAD6*, *VEGFA*, *LAMB1*, *PPARG*, *RSPO3*, *DNMT3A*, *CDC42EP3*.

### Evaluation of potential sources of heterogeneity

We tested for heterogeneity of effects to determine if the locus discovered through all ancestries meta-analysis in women (*SNX10*) was the result of increased sample size or due to heterogeneity. We used effect estimates from non-European women (Metabochip meta-analysis) and European descent-only women (GWAS+Metabochip meta-analysis) in the method outlined in Randall et al.<sup>165</sup>, and determined there was no evidence for heterogeneity.

We also performed a sensitivity analysis to evaluate if exclusion of individuals with type 2 diabetes from the meta-analysis influenced the effect estimates in sex-combined analyses. Participants with type 2

diabetes from the following studies were excluded: DGI, FUSION, Go-DARTs, WTCCC, D2D2007, DPS, DRSEXTRA, FUSIONS2, METSIM, EGCUT, EPIC, HUNT. However, excluding known diabetics had no influence on the estimated effect sizes.

### Sources of data for expression QTL analyses

Our aim was to discover *cis*-acting expression quantitative trait loci (eQTL) in multiple tissues for our lead SNPs at loci that were associated with waist-related traits (Tables 1 and 3). We performed look-ups in previously published eQTL data from multiple biologically-relevant tissues.

In the MuTHER study<sup>166</sup> expression profiling was performed using the Illumina Human HT-12 V3 BeadChips in lymphoblastoid cell lines (LCLs,  $n = 778$ ), subcutaneous adipose tissue (SAT,  $n = 776$ ) and skin ( $n = 667$ ) biopsies from monozygotic and dizygotic female twins from the United Kingdom. Genotyping was done with a combination of Illumina arrays (HumanHap300, HumanHap610Q, 1M-Duo and 1.2MDuo 1M) followed by imputation into HapMap II. Association tests between genotypes and gene expression within 1 Mb windows were performed with the GenABEL/ProbABEL packages using the polygenic linear model incorporating a kinship matrix.

In the MoLOBB study, expression profiling in abdominal and gluteal adipose tissue biopsies from 73 individuals (29 with and 44 without metabolic syndrome) were performed with the Affymetrix hgu133plus2 array, as described previously in detail<sup>167</sup>. Genotyping was done with the Illumina 317K array, and *cis* associations between genotypes and expression values were tested using linear regression models assuming additive genetic effects.

Expression data in liver ( $n = 955$ ), SAT ( $n = 610$ ), and omental fat tissue ( $n = 740$ ) from the Massachusetts General Hospital collection<sup>168</sup> was obtained using a custom Agilent 44,000 feature microarray in gastric bypass surgery patients. Genotyping was done using Illumina HumanHap650Y and Affymetrix 500K genotyping arrays followed by imputation into HapMap II. Association analyses within 1 Mb windows were performed using linear regression under an additive genetic model.

For whole blood ( $n = 743$ ) and SAT biopsies ( $n = 603$ ) from deCODE, expression profiling of 23,720 transcripts was done using custom arrays, as previously described in detail<sup>169</sup>. *Cis* associations within 1 Mb windows between each SNP (Illumina 317K or 370K chips were used for genotyping followed by imputation to HapMap II) and expression data were tested separately in men and women assuming additive genetic effects using linear regression models accounting for family structure.

In the MuTHER study<sup>166</sup> expression profiling was performed using the Illumina Human HT-12 V3 BeadChips in lymphoblastoid cell lines (LCLs,  $n = 778$ ), subcutaneous adipose tissue (SAT,  $n = 776$ ) and skin ( $n = 667$ ) biopsies from monozygotic and dizygotic female twins from the United Kingdom.

Genotyping was done with a combination of Illumina arrays (HumanHap300, HumanHap610Q, 1M-Duo and 1.2MDuo 1M) followed by imputation into HapMap II.

Expression data in LCLs from the family asthma study (MRC-A)<sup>170</sup> was obtained with Affymetrix HG-U133 Plus 2.0 chip ( $n = 405$  siblings) and Illumina Human6V1 array ( $n = 550$  siblings). Genotyping was done using Illumina arrays (Human1M and HumanHap300K) and *cis* associations between genotypes and expression values were tested using linear regression models assuming additive genetic effects.

For peripheral blood mononuclear cells (PBMCs), gene expression data was available in the integrated dataset of 1,469 healthy controls and patient samples from the United Kingdom and the Netherlands (Fehrmann-HT12v3 and Fehrmann-H8v2), and 891 individuals from Estonia (EGCUT). In Fehrmann-HT12v3 ( $N = 1,240$ ) expression profiling was performed with the Illumina HumanHT-12 array and in Fehrmann-H8v2 ( $N = 229$ ) with the Illumina HumanRef-8 v2 array as described in detail previously<sup>171</sup>. Genotyping was done using the Illumina HumanHap300, HumanHap370 or 610 Quad platform followed by imputation to HapMap II. In EGCUT, expression profiling was performed using Illumina HumanHT12v3 array while genotyping was performed with Illumina Human370CNV-duo chip followed by imputation to HapMap II as described previously<sup>172</sup>. Associations between genotype dosages and gene expression values were tested using linear regression models assuming additive genetic effects within 1 Mb windows. All 2,360 peripheral blood samples from three studies were then meta-analyzed using a z-score method, weighted for the sample size of each dataset.

### Detailed acknowledgements

**1958BC:** Data collection was funded by MRC grant G0000934 and cell-line creation by Wellcome Trust grant 068545/Z/02. Great Ormond Street Hospital/University College London, Institute of Child Health and Oxford Biomedical Research Centre, University of Oxford received a proportion of funding from the Department of Health's National Institute for Health Research (NIHR) ('Biomedical Research Centres' funding). This paper presents independent research and the views expressed are those of the author(s) and not necessarily those of the NHS, the NIHR, or the Department of Health.

**ADVANCE:** The ADVANCE study was supported by a grant from the Reynold's Foundation and NHLBI grant HL087647.

**AGES:** The Age, Gene/Environment Susceptibility Reykjavik Study (AGES) has been funded by NIH contract N01-AG-12100, the NIA Intramural Research Program, Hjartavernd (the Icelandic Heart Association), and the Althingi (the Icelandic Parliament). The study is approved by the Icelandic National Bioethics Committee, (VSN: 00-063) and the Data Protection Authority. The researchers are indebted to the participants for their willingness to participate in the study.

**Amish:** We gratefully acknowledge our Amish liaisons, field workers and clinic staff and the extraordinary cooperation and support of the Amish community, without which these studies would not have been possible. The Amish studies are supported by grants and contracts from the NIH, including U01 HL072515-06, U01 HL84756, F32AR059469, the University of Maryland General Clinical Research Center, grant M01 RR 16500, and by National Research Initiative Competitive Grant no. 2007-35205-17883 from the USDA National Institute of Food and Agriculture. We thank our Amish research volunteers for their long-standing partnership in research, and the research staff at the Amish Research Clinic for their hard work and dedication.

**ARIC:** The Atherosclerosis Risk in Communities Study is carried out as a collaborative study supported by National Heart, Lung, and Blood Institute contracts (HHSN268201100005C, HHSN268201100006C, HHSN268201100007C, HHSN268201100008C, HHSN268201100009C, HHSN268201100010C, HHSN268201100011C, and HHSN268201100012C), R01HL087641, R01HL59367 and R01HL086694; National Human Genome Research Institute contract U01HG004402; and National Institutes of Health contract HHSN268200625226C. The authors thank the staff and participants of the ARIC study for their important contributions. Infrastructure was partly supported by Grant Number UL1RR025005, a component of the National Institutes of Health and NIH Roadmap for Medical Research.

**ARIC Metabochip:** The Population Architecture Using Genomics and Epidemiology (PAGE) program is funded by the National Human Genome Research Institute (NHGRI), supported by U01HG004803 (CALiCo), U01HG004798 (EAGLE), U01HG004802 (MEC), U01HG004790 (WHI), and U01HG004801 (Coordinating Center), and their respective NHGRI ARRA supplements. The contents of this paper are solely the responsibility of the authors and do not necessarily represent the official views of the NIH. The complete list of PAGE members can be found at <http://www.pagestudy.org>. The data and materials included in this report result from collaboration between the following studies: The Multiethnic Cohort study (MEC) characterization of epidemiological architecture is funded through the NHGRI PAGE program (U01HG004802 and its NHGRI ARRA supplement). The MEC study is funded through the National Cancer Institute (R37CA54281, R01 CA63, P01CA33619, U01CA136792, and U01CA98758); Funding support for the “Epidemiology of putative genetic variants: The Women’s Health Initiative” study is provided through the NHGRI PAGE program (U01HG004790 and its NHGRI ARRA supplement). The WHI program is funded by the National Heart, Lung, and Blood Institute; NIH; and U.S. Department of Health and Human Services through contracts N01WH22110, 24152, 32100-2, 32105-6, 32108-9, 32111-13, 32115, 32118-32119, 32122, 42107-26, 42129-32, and 44221. The authors thank the WHI investigators and staff for their dedication, and the study participants for making the program possible. A full listing of WHI investigators can be found at: <http://www.whiscience.org/publications/>

WHI\_investigators\_shortlist.pdf. Funding support for the Genetic Epidemiology of Causal Variants Across the Life Course (CALiCo) program was provided through the NHGRI PAGE program (U01HG004803 and its NHGRI ARRA supplement). The following studies contributed to this manuscript and are funded by the following agencies: The Atherosclerosis Risk in Communities (ARIC) Study is carried out as a collaborative study supported by National Heart, Lung, and Blood Institute contracts N01-HC-55015, N01-HC-55016, N01-HC-55018, N01-HC-55019, N01-HC-55020, N01-HC-55021, N01-HC-55022. Assistance with phenotype harmonization, SNP selection and annotation, data cleaning, data management, integration and dissemination, and general study coordination was provided by the PAGE Coordinating Center (U01HG004801-01 and its NHGRI ARRA supplement). The National Institutes of Mental Health also contributes to the support for the Coordinating Center. The PAGE consortium thanks the staff and participants of all PAGE studies for their important contributions. Dr. North is also funded by the National Heart, Lung, and Blood Institute grant R01 – DK089256.

**BHS:** The Busselton Health Study (BHS) acknowledges the generous support for the 1994/5 follow-up study from Healthway, Western Australia and the numerous Busselton community volunteers who assisted with data collection and the study participants from the Shire of Busselton. The Busselton Health Study is supported by The Great Wine Estates of the Margaret River region of Western Australia.

**BLSA:** The BLSA was supported by the Intramural Research Program of the NIH, National Institute on Aging. The BLSA was supported by the Intramural Research Program of the NIH, National Institute on Aging.

**BRIGHT:** This work was supported by the Medical Research Council of Great Britain (grant number G9521010D); and by the British Heart Foundation (grant number PG/02/128). A.F.D. was supported by the British Heart Foundation (grant numbers RG/07/005/23633, SP/08/005/25115); and by the European Union Ingenious HyperCare Consortium: Integrated Genomics, Clinical Research, and Care in Hypertension (grant number LSHM-C7-2006-037093). The BRIGHT study is extremely grateful to all the patients who participated in the study and the BRIGHT nursing team. We would also like to thank the Barts Genome Centre staff for their assistance with this project. This work forms part of the research themes contributing to the translational research portfolio for Barts and the London Cardiovascular Biomedical Research Unit, which is supported and funded by the National Institute for Health Research. This work was facilitated by the National Institute for Research Biomedical Research Unit at Barts and MRC Programme 952010. This work was facilitated by the National Institute for Research Biomedical Research Unit at Barts and MRC Programme 952010

**CHS:** This CHS research was supported by NHLBI contracts HHSN268201200036C, HHSN268200800007C, N01HC55222, N01HC85079, N01HC85080, N01HC85081, N01HC85082, N01HC85083, N01HC85086; and NHLBI grants HL080295, HL087652, HL105756 with additional

contribution from the National Institute of Neurological Disorders and Stroke (NINDS). Additional support was provided through AG023629 from the National Institute on Aging (NIA). A full list of CHS investigators and institutions can be found at <http://www.chs-nhlbi.org/pi.htm>. The provision of genotyping data was supported in part by the National Center for Advancing Translational Sciences, CTSI grant UL1TR000124, and the National Institute of Diabetes and Digestive and Kidney Disease Diabetes Research Center (DRC) grant DK063491 to the Southern California Diabetes Endocrinology Research Center.

**CLHNS:** We thank the Office of Population Studies Foundation research and data collection teams for the Cebu Longitudinal Health and Nutrition Survey and the Mammalian Genotyping Core at University of North Carolina at Chapel Hill. This work was supported by National Institutes of Health grants DK078150, TW05596, HL085144, TW008288, T32 HL007427 and pilot funds from RR20649, ES10126, and DK56350.

**CoLaus:** The CoLaus study was supported by research grants from the Swiss National Science Foundation (grant no: 33CSCO-122661) from GlaxoSmithKline and the Faculty of Biology and Medicine of Lausanne, Gérard Waeber, Vincent Mooser, Dawn Waterworth and research nurses of CoLaus: Yolande Barreau, Anne-Lise Bastian, Binasa Ramic, Martine Moranville, Martine Baumer, Marcy Sagette, Jeanne Ecoffey, and Sylvie Mermoud.

**COROGENE:** The study was supported by grants from Aarne Koskelo Foundation, Helsinki University Central Hospital special government funds (EVO #TYH7215, #TKK2012005, #TYH2012209), and Finnish Foundation for Cardiovascular research.

**CROATIA-Vis:** The CROATIA-Vis study in the Croatian island of Vis was supported through the grants from the Medical Research Council UK to H.C., A.F.W. and I.R.; and Ministry of Science, Education and Sport of the Republic of Croatia to I.R. (number 108-1080315-0302) and the European Union framework program 6 EUROSPAN project (contract no. LSHG-CT-2006-018947). We would like to acknowledge the invaluable contributions of the recruitment team (including those from the Institute of Anthropological Research in Zagreb) in Vis, the administrative teams in Croatia and Edinburgh and the people of Vis.

**deCODE:** We thank participants in deCODE cardiovascular- and obesity studies and collaborators for their cooperation. The research performed at deCODE Genetics was part funded through the European Community's Seventh Framework Programme (FP7/2007-2013), ENGAGE project, grant agreement HEALTH-F4-2007- 201413.

**DESIR:** This study was supported in part by grants from SFD (Société Francophone du Diabète), CPER (Contrat de Projets État-Région), and ANR (Agence Nationale de la Recherche). The DESIR study has been supported by INSERM-CNAMTS (Caisse Nationale de l'Assurance Maladie des Travailleurs

Salariés), Lilly, Novartis Pharma, sanofi-aventis, INSERM (Réseaux en Santé Publique, Interactions entre les déterminants de la santé), Association Diabète Risque Vasculaire, Fédération Française de Cardiologie, Fondation de France, Onivins, Ardix Medical, Bayer Diagnostics, Becton Dickinson, Cardionics, Merck Santé, Novo Nordisk, Pierre Fabre, Roche, and Topcon.

**DGI:** The Botnia (DGI) study have been supported by grants from Folkhälsan Research Foundation, Sigrid Juselius Foundation, Ministry of Education, Nordic Center of Excellence in Disease Genetics, Gyllenberg Foundation, Swedish Cultural Foundation in Finland, Finnish Diabetes Research Foundation, Foundation for Life and Health in Finland, Finnish Medical Society, Paavo Nurmi Foundation, Perklén Foundation, Ollqvist Foundation, Närpes Health Care Foundation, the Municipal Health Care Center and Hospital in Jakobstad, Health Care Centers in Vasa, Närpes and Korsholm. This work was also partially supported by NIH grant R01-DK075787 to JNH

**DIAGEN:** The DIAGEN study was supported by the Commission of the European Communities, Directorate C - Public Health and Risk Assessment, Health & Consumer Protection, Grant Agreement number - 2004310 and by the Dresden University of Technology Funding Grant, Med Drive. We are grateful to all of the patients who cooperated in this study and to their referring physicians and diabetologists in Saxony.

**DILGOM:** The DILGOM project and this work is supported by the Academy of Finland (grant numbers 136895, 263836, 250207, 139635, 118065), the Orion-Farmos Research Foundation, and the Finnish Foundation for Cardiovascular Research. MP is partly financially supported for this work by the Finnish Academy SALVE program "Pubgensense" 129322. We are grateful for the THL DNA laboratory for its skillful work to produce the DNA samples used in this study.

**DPS:** The DPS has been financially supported by grants from the Academy of Finland (117844 and 40758, 211497, and 118590); The EVO funding of the Kuopio University Hospital from Ministry of Health and Social Affairs (5254), Finnish Funding Agency for Technology and Innovation (40058/07), Nordic Centre of Excellence on Systems biology in controlled dietary interventions and cohort studies, SYSDIET (070014), The Finnish Diabetes Research Foundation, Yrjö Jahnsson Foundation (56358), Sigrid Juselius Foundation, Juho Vainio Foundation and TEKES grants 70103/06 and 40058/07.

**DR'S EXTRA:** The DR's EXTRA Study was supported by the Ministry of Education and Culture of Finland (627;2004-2011), Academy of Finland (102318; 104943;123885), Kuopio University Hospital, Finnish Diabetes Association, Finnish Foundations for Cardiovascular Research, Päivikki and Sakari Sohlberg Foundation, by European Commission FP6 Integrated Project (EXGENESIS); LSHM-CT-2004-005272, City of Kuopio and Social Insurance Institution of Finland (4/26/2010).

**DUNDEE/GoDARTS:** The Wellcome Trust provides support for Wellcome Trust United Kingdom Type 2 Diabetes Case Control Collection (GoDARTS) (Award 099177/Z/12/Z) and the Scottish Health

Informatics Programme. Further informatics support is provided by the Chief Scientist Office of Scotland. This work was also supported by the UK Medical Research Council (G0601261).

**EGCUT:** Estonian Genome Center, University of Tartu (EGCUT) received targeted financing from Estonian Government SF0180142s08, Center of Excellence in Genomics (EXCEGEN) and University of Tartu (SP1GVARENG). We acknowledge EGCUT technical personnel, especially Mr V. Soo and S. Smit. Data analyzes were carried out in part in the High Performance Computing Center of University of Tartu.

**Ely:** We are grateful to all the volunteers and to the staff of St. Mary's Street Surgery, Ely and the study team. The Ely Study was funded by the MRC (MC\_U106179471) and Diabetes UK. Genotyping in the Ely and Fenland studies was supported in part by an MRC-GlaxoSmithKline pilot programme grant (G0701863).

**EMIL (SWABIA):** EMIL is supported by the Centre of Excellence Baden-Wuerttemberg "Metabolic Disorders" to B.O.B.

**EPIC Metabochip:** The EPIC Norfolk diabetes case cohort study is nested within the EPIC Norfolk Study, which is supported by program grants from the Medical Research Council, and Cancer Research UK and with additional support from the European Union, Stroke Association, British Heart Foundation, Research into Ageing, Department of Health, The Wellcome Trust and the Food Standards Agency. Genotyping was in part supported by the MRC-GSK pilot program grant. We acknowledge the contribution of the staff and participants of the EPIC-Norfolk Study.

**EPIC-Norfolk (GWAS):** The EPIC Norfolk study is supported by program grants from the Medical Research Council, and Cancer Research UK. We acknowledge the contribution of the staff and participants of the EPIC-Norfolk Study.

**ERF:** ERF study as a part of EUROSPAN (European Special Populations Research Network) was supported by European Commission FP6 STRP grant number 018947 (LSHG-CT-2006-01947) and also received funding from the European Community's Seventh Framework Programme (FP7/2007-2013)/grant agreement HEALTH-F4-2007-201413 by the European Commission under the program "Quality of Life and Management of the Living Resources" of 5th Framework Programme (no. QLG2-CT-2002-01254). High-throughput analysis of the ERF data was supported by joint grant from Netherlands Organization for Scientific Research and the Russian Foundation for Basic Research (NWO-RFBR 047.017.043). We are grateful to all study participants and their relatives, general practitioners and neurologists for their contributions and to P. Veraart for her help in genealogy, J. Vergeer for the supervision of the laboratory work and P. Snijders for his help in data collection.

**FamHS:** The Family Heart Study was supported by the by grants R01-HL-087700, and R01-HL-088215 from the National Heart, Lung, and Blood Institute.

**FBPP:** No acknowledgements.

**Fenland (Metabochip/GWAS):** The Fenland Study is funded by the Wellcome Trust and the Medical Research Council (MC\_U106179471). We are grateful to all the volunteers for their time and help and to the General Practitioners and practice staff for assistance with recruitment. We thank the Fenland Study Investigators, Fenland Study Co-ordination team and the Epidemiology Field, Data and Laboratory teams.

**FIN-D2D (2007):** The FIN-D2D study has been financially supported by the hospital districts of Pirkanmaa, South Ostrobothnia, and Central Finland, the Finnish National Public Health Institute (current National Institute for Health and Welfare), the Finnish Diabetes Association, the Ministry of Social Affairs and Health in Finland, the Academy of Finland (grant number 129293), Commission of the European Communities, Directorate C-Public Health (grant agreement no. 2004310) and Finland's Slottery Machine Association.

**FTC (Finnish Twin Cohort):** This study was funded through ENGAGE (European Network for Genetic and Genomic Epidemiology), FP7-HEALTH-F4-2007, grant agreement number 201413; Academy of Finland (265240, 263278).

**FRAM:** This research was conducted in part using data and resources from the Framingham Heart Study of the National Heart Lung and Blood Institute of the National Institutes of Health and Boston University School of Medicine. The analyses reflect intellectual input and resource development from the Framingham Heart Study investigators participating in the SNP Health Association Resource (SHARe) project. This work was partially supported by the National Heart, Lung and Blood Institute's Framingham Heart Study (Contract No. N01-HC-25195) and its contract with Affymetrix, Inc for genotyping services (Contract No. N02-HL-6-4278). A portion of this research utilized the Linux Cluster for Genetic Analysis (LinGA-II) funded by the Robert Dawson Evans Endowment of the Department of Medicine at Boston University School of Medicine and Boston Medical Center.

**FUSION GWAS cases and controls:** Support for FUSION was provided by NIH grants R01-DK062370 (to M.B.), R01-DK072193 (to K.L.M.), and intramural project number 1Z01-HG000024 (to F.S.C.). Genome-wide genotyping was conducted by the Johns Hopkins University Genetic Resources Core Facility SNP Center at the Center for Inherited Disease Research (CIDR), with support from CIDR NIH contract no. N01-HG-65403.

**FUSION Stage 2 cases and controls:** Support for FUSION was provided by NIH grants R01-DK062370 (to M.B.), R01-DK072193 (to K.L.M.), and intramural project number 1Z01-HG000024 (to F.S.C.). Genome-wide genotyping was conducted by the Johns Hopkins University Genetic Resources Core Facility SNP Center at the Center for Inherited Disease Research (CIDR), with support from CIDR NIH contract no. N01-HG-65403.

**GEFOS Consortium:** The Genetic Factors for Osteoporosis (GEFOS) consortium have been funded by the European Commission (HEALTH-F2-2008-201865-GEFOS)

**GENIE Consortium:** The GENIE Consortium is supported by NIH NIDDK R01 DK081923, a US Ireland R&D partnership award funded by Science Foundation Ireland under Grant No.SFI/08/US/B1517, the Northern Ireland Research Development office, and the Juvenile Diabetes Research Foundation (JDRF). The Warren 3/UK GoKinD Study Group was jointly funded by Diabetes UK and the JDRF. The FinnDiane Study Group consists of A.Ahola, E. Fagerholm, M. Feodoroff, C. Fogarty, C. Forsblom, D. Gordin, PH. Groop, V.Harjutsalo, O. Heikkilä, E. Hietala, K Hietala, S. Hägg, J. Kytö, M. Lassenius, S. Lindh, M. Lehto, R. Lithovius, VP. Mäkinen, M. Parkkonen, L. Peräneva, K. Pettersson-Fernholm, J. Pihlman, M. Rahkonen, M. Rosengård-Bärlund, A. Sandelin, A-R Salonen, N. Sandholm, L. Salovaara, M. Saraheimo, R. Simonsen, T. Soppela, A. Soro-506 Paavonen, N. Ström, A. Syreeni, J. Söderlund, L. Thorn, H. Tikkanen, N. Tolonen, J.Tuomikangas, N. Vuori, J. Wadén. The FinnDiane Study was supported by grants from the Folkhälsan Research Foundation, the Wilhelm and Else Stockmann Foundation, Liv och Hälsa Foundation, Helsinki University Central Hospital Research Funds (EVO), the Sigrid Juselius Foundation, the Signe and Ane Gyllenberg Foundation, Finska Läkaresällskapet, Academy of Finland (134379), Tekes, and the European Union's Seventh Framework Program (FP7/2007-2013) for the Innovative Medicine Initiative under grant agreement n° IMI/115006 (the SUMMIT consortium). Rany Salem was supported by a JDRF post-doctoral fellowship (#3-2011-70). We acknowledge the physicians, nurses and researchers at each center participating in the collection of participants, and we are grateful to our colleagues at the Renal Unit, Mater Misericordiae University Hospital, Dublin, Ireland.

**GenNet:** We would like to acknowledge and thank all participants in the GenNet study. Our work was funded by the NHLBI grant U10 HL054512. Georg Ehret is funded by the University of Geneva and the Swiss National Foundation.

**GLACIER:** The GLACIER (Gene-Lifestyle interactions And Complex traits Involved in Elevated disease Risk Study) Study was funded by grants from the Swedish Diabetes Association, Swedish Heart-Lung Foundation, Swedish Research Council, Medical Research Foundation of Umeå University, and Novo Nordisk (all to PWF). We thank the participants for there outstanding contributions to the GLACIER Study. We also thank the staff of the Umeå Medical Biobank, especially Åsa Agren, John Hutilainen, and Ann-Marie Ahren for data reteival and organisation and Kerstin Enqusit and Tore Johansson for expert assistance with DNA extraction and plating. The GLACIER Study is nested within the Västerbottens Intervention Project (VIP); we thank the staff of the VIP Study for phenotype data collection, particularly Lars Wennehall who leads the VIP Study. Inês Barroso acknowledges funding from the Wellcome Trust grant 07 WT098051, United Kingdom NIHR Cambridge Biomedical Research Centre and the MRC Centre for Obesity and Related Metabolic Diseases. We would like to thank Emma Gray, Douglas Simpkin, Sarah Hunt and staff of the WTSI Sample Logistics, Genotyping and Variation Informatics Facilities. The authors would like to thank Sarah Edkins, Douglas Simpkin and staff of the WTSI genotyping facility.

**GOOD:** Financial support was received from the Swedish Research Council, the Swedish Foundation for Strategic Research, the ALF/LUA research grant in Gothenburg, the Lundberg Foundation, the Torsten and Ragnar Söderberg's Foundation, the Novo Nordisk Foundation, and the European Commission grant HEALTH-F2-2008-201865-GEFOS.

**GxE:** Our chief acknowledgement is to the participants in these studies for their willingness to contribute. We also thank Nurses Orgen Brown and Diedre Thomas for assistance with recruitment as well as past and present Laboratory technologists and drivers at TMRU for their invaluable technical assistance. This work was supported by NIH Grants R01HL53353 and R01DK075787.

**H2000 GENMETS Sub Sample (Health 2000:** Health and Functional Capacity of Finns) - a national health survey) - We would like to thank all H2000 cohort participants. The Health 2000 Study was funded by the National Institute for Health and Welfare (THL), the Finnish Centre for Pensions (ETK), the Social Insurance Institution of Finland (KELA), the Local Government Pensions Institution (KEVA) and other organizations listed on the website of the survey (<http://www.terveys2000.fi>). We also want to thank the Sanger Institute for genotyping the GenMets subcohort.

**HBCS (Helsinki Birth Cohort Study):** We thank all study participants as well as everybody involved in the Helsinki Birth Cohort Study. Helsinki Birth Cohort Study has been supported by grants from the Academy of Finland, the Finnish Diabetes Research Society, Folkhälsan Research Foundation, Novo Nordisk Foundation, Finska Läkaresällskapet, Signe and Ane Gyllenberg Foundation, Ahokas Foundation, Emil Aaltonen Foundation, Juho Vainio Foundation, and Wellcome Trust (grant number WT089062).

**Health ABC:** The Health ABC Study was supported by NIA contracts N01AG62101, N01AG62103, and N01AG62106 and, in part, by the NIA Intramural Research Program. The genome-wide association study was funded by NIA grant 1R01AG032098-01A1 to Wake Forest University Health Sciences and genotyping services were provided by the Center for Inherited Disease Research (CIDR). CIDR is fully funded through a federal contract from the National Institutes of Health to The Johns Hopkins University, contract number HHSN268200782096C. This study utilized the high-performance computational capabilities of the Biowulf Linux cluster at the National Institutes of Health, Bethesda, Md.

(<http://biowulf.nih.gov>).

**HERITAGE Family Study:** The HERITAGE Family Study has been funded by National Heart, Lung, and Blood Institute grants HL-45670, HL-47323, HL-47317, HL-47327, and HL-47321 (to C. Bouchard, T. Rankinen, D.C. Rao, Arthur Leon, James Skinner, and Jack Wilmore). Thanks are expressed to Drs. Arthur Leon, James Skinner, and Jack Wilmore for their contributions to the data collection. C. Bouchard is partially funded by the John W. Barton, Sr. Chair in Genetics and Nutrition. We thank Ms. Jessica Watkins and Ms. Kathryn Cooper for their expert contributions to GWAS and replication genotyping and DNA bank maintenance.

**Heinz Nixdorf Recall (HNR) Study:** We thank the Heinz Nixdorf Foundation, Germany, for their generous support of this study. We acknowledge the support of the Sarstedt AG & Co. (Nümbrecht, Germany) concerning laboratory equipment. We are grateful to Prof. Susanne Moebus (Institute for Medical Informatics, Biometry and Epidemiology (IMIBE), University Hospital Essen, Essen, Germany) and Prof. Dirk Schadendorf (Clinic Department of Dermatology, University Hospital Essen, Essen, Germany) for funding this study. We are also thankful to Prof. Markus M Noethen (Institute of Human Genetics, University of Bonn, Bonn, Germany and Department of Genomics, Life & Brain Center, University of Bonn, Bonn, Germany) for funding and carrying out the genotyping.

**HUNT2:** The Nord-Trøndelag Health Study (The HUNT Study) is a collaboration between HUNT Research Centre (Faculty of Medicine, Norwegian University of Science and Technology NTNU), Nord-Trøndelag County Council, Central Norway Health Authority, and the Norwegian Institute of Public Health.

**HyperGEN:** The Hypertension Genetic Epidemiology Network is funded by cooperative agreements (U10) with NHLBI: HL54471, HL54472, HL54473, HL54495, HL54496, HL54497, HL54509, HL54515 and by R01 HL55673.

**HYPERGENES:** The HYPERGENES study was funded under HYPERGENES (FP7 - HEALTH-F4-2007-201550) and INTEROMICS (MIUR - CNR Italian Flagship Project).

The HYPERGENES consortium members that took part include, 1) University of Milano and Fondazione Filarete with Daniele Cusi, Project Coordinator, Cristina Barlassina, Erika Salvi, Sara Lupoli, Maurizio Marconi, Gianna Petrini, Vincenzo Toschi; 2) Katholieke Universiteit Leuven, with Jan Staessen, Jan Staessen, Tatiana Kuznetsova, Lutgarde Thijs; 3) Jagiellonian University Medical College, Krakow, with Kalina Kawecka-Jaszcz, Katarzyna Stolarz, Agnieszka Olszanecka, Wiktoria Wojciechowska; 4) IBM Israel – Science and Technology LTD, with Amnon Shabo, Ariel Frakash, Simona Cohen, Boaz Carmeli, Dan Pelleg, Michal Rosen-Zvi, Hani Neuvirth-Telem; 5) I.M.S. – Istituto di Management Sanitario S.r.l., Milan, with Pietro Conti, Costanza Conti, Mariella D'Alessio; 6) Institute of Internal Medicine, Siberian Branch of Russian Academy of Medical Sciences, Novosibirsk, with Yuri Nikitin, Sofia Malyutina, M. Voevoda, Andrew Ryabikov, E. Pello, Maxim Ryabikov; 7) Imperial College of Science, Technology and Medicine, with Paolo Vineis and Clive J Hoggart; 8) INSERM – Institut National de la Santé et de la Recherche Médicale U772, with Xavier Jeunemaitre, Pierre-François Plouin, Anne-Paule Gimenez-Roqueplo, Rosa Vargas-Poussou, Geneviève Beaurain; 9) University of Warwick. Cardiovascular Medicine & Epidemiology Group, Clinical Sciences Research Institute, with Francesco P Cappuccio, Michelle A Miller, Chen Ji; 10) Hypertension and Related Diseases Centre-AOU, University of Sassari Medical School, with Nicola Glorioso, Chiara Maria Troffa, Giuseppe Argiolas, Francesca Fau, Silvia Pitzoi, Roberta Zaninello and Maria Francesca Ortu; 11) STMICROELECTRONICS SRL, with Enrico Rosario Alessi; 12) Universite de Lausanne. Department of Medical Genetics, with Carlo Rivolta, Jacques

S. Beckmann, Zoltan Kutalik, Paola Benaglio; 13) Pharnext S.A.S., Paris, with Daniel Cohen and Ilya Chumakov; 14) Softeco Sismat Spa, Genova, with Stefano Bianchi; 15) Shanghai Institute of Hypertension, with Jiguang Wang and Li Yan; 16) Charles University in Prague. Department of Internal Medicine II, Pilsen, with Jan Filipovsky, Otto Mayer, Milan Hromadka, Jitka Seidlerova, Milena Dolejsova, Lukas Handl; 17) Università degli Studi di Padova. Department of Clinical and Experimental Medicine, with Edoardo Casiglia, Valerie Tikhonoff, Laura Schiavon, Anna Bascelli, Elisa Pagnin; 18) Medical University of Gdansk. Hypertension Unit, Department of Hypertension and Diabetology, with Krzysztof Narkiewicz, Marzena Chrostowska, Radoslaw Szczech, Michal Hoffmann; and 19) University Vita-Salute San Raffaele, with Paolo Manunta, Chiara Lanzani, Maria Teresa Sciarra, Lorena Citterio, Laura Zagato.

**Improve:** This study was supported by the European Commission (LSHM-CT- 2007- 037273), the Swedish Heart-Lung Foundation, the Swedish Research Council (8691), the Knut and Alice Wallenberg Foundation, the Foundation for Strategic Research, the Torsten and Ragnar Söderberg Foundation, the Strategic Cardiovascular Programme of Karolinska Institutet and the Stockholm County Council and the Stockholm County Council (560183).

**InCHIANTI:** The InCHIANTI study baseline (1998-2000) was supported as a "targeted project" (ICS110.1/RF97.71) by the Italian Ministry of Health and in part by the U.S. National Institute on Aging (Contracts: 263 MD 9164 and 263 MD 821336); the InCHIANTI Follow-up 1 (2001-2003) was funded by the U.S. National Institute on Aging (Contracts: N.1-AG-1-1 and N.1-AG-1-2111)

**KORA Studies (Cooperative Health Research in the Region of Augsburg, Kooperative Gesundheitsforschung in der Region Augsburg) -** The KORA research platform was initiated and financed by the Helmholtz Zentrum München - German Research Center for Environmental Health, which is funded by the German Federal Ministry of Education and Research (BMBF) and by the State of Bavaria. Furthermore, KORA research was supported within the Munich Center of Health Sciences (MC Health), Ludwig-Maximilians-Universität, as part of LMUinnovativ. Part of this project was supported by BMBF grant number 01GS0823 and grant number 01GS0834 (German National Genome Research Network, NGFNPlus)

**Leipzig adults:** This work was supported by grants from the German Research Council (SFB- 1052 "Obesity mechanisms"), from the German Diabetes Association and from the DHFD (Diabetes Hilfs- und Forschungsfonds Deutschland). Peter Kovacs is funded by the Boehringer Ingelheim Foundation. IFB AdiposityDiseases is supported by the Federal Ministry of Education and Research (BMBF), Germany, FKZ: 01EO1001. This work was further supported by the Kompetenznetz Adipositas (Competence network for Obesity) funded by the Federal Ministry of Education and Research (German Obesity Biomaterial Bank; FKZ 01GI1128). Inga Prokopenko was funded in part through the European

Community's Seventh Framework Programme (FP7/2007-2013), ENGAGE project, and grant agreement HEALTH-F4-2007-201413.

**LifeLines:** The LifeLines Cohort Study, and generation and management of GWAS genotype data for the LifeLines Cohort Study is supported by the Netherlands Organization of Scientific Research NWO (grant 175.010.2007.006), the Economic Structure Enhancing Fund (FES) of the Dutch government, the Ministry of Economic Affairs, the Ministry of Education, Culture and Science, the Ministry for Health, Welfare and Sports, the Northern Netherlands Collaboration of Provinces (SNN), the Province of Groningen, University Medical Center Groningen, the University of Groningen, Dutch Kidney Foundation and Dutch Diabetes Research Foundation. We thank Behrooz Alizadeh, Annemieke Boesjes, Marcel Bruinenberg, Noortje Festen, Pim van der Harst, Ilja Nolte, Lude Franke, Mitra Valimohammadi for their help in creating the GWAS database, and Rob Bieringa, Joost Keers, René Oostergo, Rosalie Visser, Judith Vonk for their work related to data-collection and validation. The authors are grateful to the study participants, the staff from the LifeLines Cohort Study and Medical Biobank Northern Netherlands, and the participating general practitioners and pharmacists.

**LLS:** The research leading to these results has received funding from the European Union's Seventh Framework Programme (FP7/2007-2011) under grant agreement number 259679. This study was financially supported by the Innovation-Oriented Research Program on Genomics (SenterNovem IGE05007), the Centre for Medical Systems Biology and the Netherlands Consortium for Healthy Ageing (grant 050-060-810), all in the framework of the Netherlands Genomics Initiative, Netherlands Organization for Scientific Research (NWO), by Unilever Colworth and by BBMRI-NL, a Research Infrastructure financed by the Dutch government (NWO 184.021.007).

**LOLIPOP:** The LOLIPOP study is supported by the National Institute for Health Research (NIHR) Comprehensive Biomedical Research Centre Imperial College Healthcare NHS Trust, the NIHR Cardiovascular Biomedical Research Unit of Royal Brompton and Harefield NHS Foundation Trust, the British Heart Foundation (SP/04/002), the Medical Research Council (G0601966, G0700931), the Wellcome Trust (084723/Z/08/Z) the NIHR (RP-PG-0407-10371), European Union FP7 (EpiMigrant, 279143) and Action on Hearing Loss (G51). We thank the participants and research staff who made the study possible. LOLIPOP\_EW610 study was supported by the Wellcome Trust. We thank the participants and research teams involved in LOLIPOP. LOLIPOP\_EWA thanks GSK for supporting and genotyping of the data. LOLIPOP\_EWP study was supported by the British Heart Foundation Grant (SP/04/002). LOLIPOP\_IA610 study was supported by the Wellcome Trust. We thank the participants and research teams involved in LOLIPOP. LOLIPOP\_IA317 and LOLIPOP\_IAP studies were supported by the British Heart Foundation Grant (SP/04/002).

**LURIC:** We extend our appreciation to the participants of the LURIC study; without their collaboration, this article would not have been written. We thank the LURIC study team who were either temporarily or permanently involved in patient recruitment as well as sample and data handling, in addition to the laboratory staff at the Ludwigshafen General Hospital and the Universities of Freiburg and Ulm, Germany. LURIC has received funding from the 6th Framework Program (integrated project Bloodomics, grant LSHM-CT-2004-503485) and from the 7th Framework Program (Atheroremo, grant agreement number 201668 and RiskyCAD, grant agreement number 305739) of the European Union.

**METSIM:** The METSIM study was funded by the Academy of Finland (grants no. 77299 and 124243).

**MICROS:** In South Tyrol, the study was supported by the Ministry of Health and Department of Educational Assistance, University and Research of the Autonomous Province of Bolzano, and the South Tyrolean Sparkasse Foundation. For the MICROS study, we thank the primary care practitioners Raffaella Stocker, Stefan Waldner, Toni Pizzecco, Josef Plangger, Ugo Marcadent, and the personnel of the Hospital of Silandro (Department of Laboratory Medicine) for their participation and collaboration in the research project.

**MORGAM:** The MORGAM study was partly funded through the European Community's Sixth Framework Programme Cardiogenics project, grant agreement LSHM-CT-2006-037593 and Seventh Framework Programme ENGAGE project, grant agreement HEALTH-F4-2007-201413. We would like to acknowledge the staff from the Genotyping Facilities at the Wellcome Trust Sanger Institute for genotyping the data.

**PRIME:** The PRIME Study was supported by grants from Inserm, Merck Sharp and Dohme-Chibret Laboratory, the French Research Agency and the Foundation Heart and Arteries. We thank the following organizations that allowed the recruitment of participants for the PRIME: the health screening centers organized by the Social Security of Lille (Institut Pasteur), Strasbourg, Toulouse, and Tourcoing; the occupational medicine services of Haute-Garonne and of the Urban Community of Strasbourg; the Association Inter-entreprises des Services Médicaux du Travail de Lille et environs; the Comité pour le Développement de la Médecine du Travail; the Mutuelle Générale des Postes, Télégraphes et Téléphones du Bas-Rhin; the Laboratoire d'Analyses de l'Institut de Chimie Biologique de la Faculté de Médecine de Strasbourg; We also gratefully acknowledge the teams of the Lille, Strasbourg and Toulouse centres for their dedicated work and relentless energy in following up their cohorts; the contribution of the members of the event validation committees : L Guize; C Morrison; M-T Guillanneuf; and M Giroud and the Alliance Partnership Programme for its financial support. Sites and key personnel of contributing MORGAM Centers included- *Finland:* FINRISK, National Institute for Health and Welfare, Helsinki: V. Salomaa (principal investigator), A. Juolevi, E. Vartiainen, P. Jousilahti; ATBC, National Institute for Health and Welfare, Helsinki: J. Virtamo (principal investigator), H. Kilpeläinen; MORGAM Data Centre, National

Institute for Health and Welfare, Helsinki: K. Kuulasmaa (responsible person), Z. Cepaitis, A. Haukijärvi, B. Joseph, J. Karvanen, S. Kulathinal, M. Niemelä, O. Saarela; MORGAM Central Laboratory, National Institute for Health and Welfare, Helsinki: M. Perola (responsible person), P. Laiho, M. Sauramo. The ATBC Study was supported by US Public Health Service contracts N01-CN-45165, N01-RC-45035 and N01-RC-37004 from the National Cancer Institute. *France*: National Coordinating Centre, National Institute of Health and Medical Research (U258), Paris: P. Ducimetière (national coordinator), A. Bingham; PRIME/Strasbourg, Department of Epidemiology and Public Health, EA 3430, University of Strasbourg, Faculty of Medicine, Strasbourg: D. Arveiler (principal investigator), B. Haas, A. Wagner; PRIME/Toulouse, UMR INSERM 1027; and Department of Epidemiology, Toulouse University School of Medicine, Université Paul Sabatier, Toulouse: J. Ferrières (principal investigator), J-B. Ruidavets, V. Bongard, D. Deckers, C. Saulel, S. Barrere; PRIME/Lille, Department of Epidemiology and Public Health, INSERM U744-Université Lille Nord de France – Institut Pasteur de Lille: P. Amouyel (principal investigator), M. Montaye, B. Lemaire, S. Beauchant, D. Cottel, C. Graux, N. Marecaux, C. Steclebout, S. Szeremeta; MORGAM Laboratory, INSERM U937, Paris: F. Cambien (responsible person), L. Tired, V. Nicaud. INSERM and InVS are acknowledged for their support. *Italy*: EPIMED Research Center Department of Clinical and Experimental Medicine. University of Insubria, Varese: M. Ferrario (principal investigator), G. Veronesi. Research Centre on Public Health, University of Milano-Bicocca, Monza, Italy, Giancarlo Cesana. This study was supported by the Health Administration of Regione Lombardia [grant numbers 9783/1986, 41795/1993, 31737/1997, 17155/2004 and 10800/2009], for the baseline examinations and the follow-up. Paolo Brambilla and Stefano Signorini, Laboratory Medicine, Hospital of Desio are thanked for their support. *United Kingdom*: PRIME/Belfast, Queen's University Belfast, Belfast, Northern Ireland: F. Kee (principal investigator) A. Evans (former principal investigator), J. Yarnell, E. Gardner; MORGAM Coordinating Centre, Queen's University Belfast, Belfast, Northern Ireland: A. Evans (MORGAM coordinator), S. Cashman, F. Kee. UKCRC are acknowledged for their support. *MORGAM Management Group*: A. Evans (chair, Belfast, UK), S. Blankenberg (Hamburg, Germany), F. Cambien (Paris, France), M. Ferrario (Varese, Italy), K. Kuulasmaa (Helsinki, Finland), A. Palotie (Cambridge, UK), M. Perola (Helsinki, Finland), A. Peters (Neuherberg, Germany), V. Salomaa (Helsinki, Finland), H. Tunstall-Pedoe (Dundee, Scotland), P.G. Wiklund (Umeå, Sweden); Previous members: K. Asplund (Stockholm, Sweden), L. Peltonen (Helsinki, Finland), D. Shields (Dublin, Ireland), B. Stegmayr (Umeå, Sweden).

**MuTHER consortium (TwinsUK):** The MuTHER Study was funded by a program grant from the Wellcome Trust (081917/Z/07/Z) and core funding for the Wellcome Trust Centre for Human Genetics (090532). Genotyping of TwinsUK samples was provided by the Wellcome Trust Sanger Institute and the National Eye Institute via an NIH/CIDR genotyping project. Additional funding came from European

Community's Seventh Framework Programme (FP7/2007-2013)/grant agreement, ENGAGE project grant agreement HEALTH-F4-2007-201413, the Swiss National Science Foundation, the Louis-Jeantet Foundation and a National Institutes of Health-NIMH grant (GTEx project, R01 MH090941). TwinsUK also receives support from the Department of Health via the National Institute for Health Research (NIHR) comprehensive Biomedical Research Centre award to Guy's & St Thomas' NHS Foundation Trust in partnership with King's College London and a Biotechnology and Biological Sciences Research Council (BBSRC) project grant (G20234). TDS is an NIHR senior Investigator and ERC Senior Investigator. MIMcC is supported by the Wellcome Trust (Core Grant Number 083270/Z/07/Z.).

**NESDA:** Netherlands Study of Depression and Anxiety (NESDA) funding was obtained through the Geestkracht program of the Netherlands Organization for Health Research and Development (Zon-MW, grant number 10-000-1002), Center for Medical Systems Biology (CSMB, NWO Genomics), NBIC/BioAssist/RK(2008.024), Biobanking and Biomolecular Resources Research Infrastructure (BBMRI-NL), the VU University's Institute for Health and Care Research (EMGO+) and Neuroscience Campus Amsterdam (NCA), the European Community's Seventh Framework Program ENGAGE (HEALTH-F4-2007-201413), and the National Institutes of Health (Grand Opportunity grants 1RC2MH089951-01 and 1RC2 MH089995-01). Part of the genotyping and analyses were funded by the Genetic Association Information Network (GAIN) of the Foundation for the National Institutes of Health.

**NFBC66:** NFBC1966 received financial support from the Academy of Finland (project grants 104781, 120315, 129269, 1114194, 24300796, Center of Excellence in Complex Disease Genetics and SALVE), University Hospital Oulu, Biocenter, University of Oulu, Finland (75617), NHLBI grant 5R01HL087679-02 through the STAMPEED program (1RL1MH083268-01), NIH/NIMH (5R01MH63706:02), ENGAGE project and grant agreement HEALTH-F4-2007-201413, and the Medical Research Council, UK (G0500539, G0600705, G1002319, PrevMetSyn/SALVE, ). The DNA extractions, sample quality controls, biobank up-keeping and aliquotting was performed in the National Public Health Institute, Biomedicum Helsinki, Finland and supported financially by the Academy of Finland and Biocentrum Helsinki. We thank the late Professor Paula Rantakallio (launch of NFBC1966), and Ms Outi Tornwall and Ms Minttu Jussila (DNA biobanking). The authors would like to acknowledge the contribution of the late Academician of Science Leena Peltonen.

**NHS and HPFS:** These studies were funded by NIH U01CA-098233, R01HL71981, DK091718, DK046200.

**NSHD:** This work was funded by the Medical Research Council (U123092720). We are very grateful to the members of this birth cohort for their continuing interest and participation in the study.

**NTRNESDA (Netherlands Twin Registry):** Funding was obtained from the Netherlands Organization for Scientific Research (NWO: MagW/ZonMW grants 904-61-090, 985-10-002, 904-61-193,480-04-004,

400-05-717, Addiction-31160008, Middelgroot-911-09-032, Spinozapremie 56-464-14192), Center for Medical Systems Biology (CSMB, NWO Genomics), NBIC/BioAssist/RK(2008.024), Biobanking and Biomolecular Resources Research Infrastructure (BBMRI –NL, 184.021.007), the VU University's Institute for Health and Care Research (EMGO+ ) and Neuroscience Campus Amsterdam (NCA), the European Science Foundation (ESF, EU/QLRT-2001-01254), the European Community's Seventh Framework Program (FP7/2007-2013), ENGAGE (HEALTH-F4-2007-201413); the European Science Council (ERC Advanced, 230374), Rutgers University Cell and DNA Repository (NIMH U24 MH068457-06), the Avera Institute, Sioux Falls, South Dakota (USA), and the National Institutes of Health (NIH, R01D0042157-01A, Grand Opportunity grants 1RC2MH089951-01 and 1RC2 MH089995-01). Part of the genotyping and analyses were funded by the Genetic Association Information Network (GAIN) of the Foundation for the National Institutes of Health.

**ORCADES:** ORCADES was supported by the Chief Scientist Office of the Scottish Government, the Royal Society, the MRC Human Genetics Unit, Arthritis Research UK and the European Union framework program 6 EUROSPAN project (contract no. LSHG-CT-2006-018947). DNA extractions were performed at the Wellcome Trust Clinical Research Facility in Edinburgh. We would like to acknowledge the invaluable contributions of Lorraine Anderson and the research nurses in Orkney, the administrative team in Edinburgh and the people of Orkney.

**PIVUS:** Genotyping was performed by the SNP&SEQ Technology Platform in Uppsala ([www.genotyping.se](http://www.genotyping.se)). We thank Tomas Axelsson, Ann-Christine Wiman and Caisa Pöntinen for their excellent assistance with genotyping. The SNP Technology Platform is supported by Uppsala University, Uppsala University Hospital and the Swedish Research Council for Infrastructures. E.I. is supported by grants from the Swedish Research Council, the Swedish Heart-Lung Foundation, the Swedish Foundation for Strategic Research, and the Royal Swedish Academy of Science.

**PREVEND:** PREVEND genetics is supported by the Dutch Kidney Foundation (Grant E033), the National Institutes of Health (grant LM010098), The Netherlands Organization for Scientific Research (NWO-Groot 175.010.2007.006, NWO VENI grant 916.761.70 and 916.10.117, ZonMW 90.700.441), and the Dutch Inter University Cardiology Institute Netherlands. N. Verweij is supported by the Netherlands Heart Foundation (grant NHS2010B280).

**PROCARDIS** (Precocious Coronary Artery Disease Consortium): PROCARDIS was supported by the European Community Sixth Framework Program (LSHM-CT- 2007-037273), AstraZeneca, the Swedish Research Council, the Knut and Alice Wallenberg Foundation, the Swedish Heart-Lung Foundation, the Torsten and Ragnar Söderberg Foundation, the Strategic Cardiovascular Program of Karolinska Institutet and Stockholm County Council, the Foundation for Strategic Research and the Stockholm County Council

(560283). M.F. and H.W. acknowledge support from the Oxford British Heart Foundation Centre of Research Excellence and a Wellcome Trust core award (090532/Z/09/Z).

**PROMIS:** This work was funded by the Wellcome Trust (core grant 098051). We would like to thank the members of the Wellcome Trust Sanger Institute Genotyping Facility.

**QFS:** The Quebec Family Study (QFS) was funded by multiple grants from the Medical Research Council of Canada and the Canadian Institutes for Health Research. This work was supported by a team grant from the Canadian Institutes for Health Research (FRCN-CCT-83028).

**RISC:** The RISC Study is partly supported by EU grant QLGI-CT-2001-01252. Additional support for the RISC Study has been provided by AstraZeneca (Sweden).

**RSI/RSII/RSIII:** The Rotterdam Study is funded by Erasmus Medical Center and Erasmus University, Rotterdam, Netherlands Organization for the Health Research and Development (ZonMw), the Research Institute for Diseases in the Elderly (RIDE), the Ministry of Education, Culture and Science, the Ministry for Health, Welfare and Sports, the European Commission (DG XII), and the Municipality of Rotterdam. The authors are grateful to the study participants, the staff from the Rotterdam Study and the participating general practitioners and pharmacists. The generation and management of GWAS genotype data for the Rotterdam Study is supported by the Netherlands Organisation of Scientific Research NWO Investments (nr. 175.010.2005.011, 911-03-012). This study is funded by the Research Institute for Diseases in the Elderly (014-93-015; RIDE2), the Netherlands Genomics Initiative (NGI)/Netherlands Organisation for Scientific Research (NWO) project nr. 050-060-810. We thank Pascal Arp, Mila Jhamai, Marijn Verkerk, Lizbeth Herrera and Marjolein Peters for their help in creating the GWAS database, and Karol Estrada and Maksim V. Struchalin for their support in creation and analysis of imputed data. We would like to thank Karol Estrada, Dr. Fernando Rivadeneira, Dr. Tobias A. Knoch, Anis Abuseiris, Luc V. de Zeeuw, and Rob de Graaf (Erasmus MC Rotterdam, The Netherlands), for their help in creating GRIMP, and BigGRID, MediGRID, and Services@MediGRID/D-Grid, (funded by the German Bundesministerium fuer Forschung und Technology; grants 01 AK 803 A-H, 01 IG 07015 G) for access to their grid computing resources.

**SardiNIA:** We thank all the volunteers who generously participated in this study, Monsignore Piseddu, Bishop of Ogliastra and the mayors and citizens of the Sardinian towns (Lanusei, Ilbono, Arzana, and Elini). This work was supported by the Intramural Research Program of the National Institute on Aging (NIA), National Institutes of Health (NIH). The SardiNIA ("Progenia") team was supported by Contract NO1-AG-1-2109 from the NIA; the efforts of GRA were supported in part by contract 263-MA-410953 from the NIA to the University of Michigan and by research grant HG002651 and HL084729 from the NIH (to GRA).

**SCARFSHEEP:** The Swedish Heart-Lung Foundation, the Swedish Research Council, the Strategic Cardiovascular Programme of Karolinska Institutet and the Stockholm County Council, the Strategic support for epidemiological research at Karolinska Institutet and the Stockholm County Council

**SHIP/SHIP-TREND:** SHIP is part of the Community Medicine Research net of the University of Greifswald, Germany, which is funded by the Federal Ministry of Education and Research (grants no. 01ZZ9603, 01ZZ0103, and 01ZZ0403), the Ministry of Cultural Affairs as well as the Social Ministry of the Federal State of Mecklenburg-West Pomerania, and the network 'Greifswald Approach to Individualized Medicine (GANI\_MED)' funded by the Federal Ministry of Education and Research (grant 03IS2061A). Genome-wide data have been supported by the Federal Ministry of Education and Research (grant no. 03ZIK012) and a joint grant from Siemens Healthcare, Erlangen, Germany and the Federal State of Mecklenburg- West Pomerania. The University of Greifswald is a member of the 'Center of Knowledge Interchange' program of the Siemens AG and the Caché Campus program of the InterSystems GmbH.

**Sorbs:** This work was supported by grants from the German Research Council (SFB- 1052 "Obesity mechanisms"), from the German Diabetes Association and from the DHFD (Diabetes Hilfs- und Forschungsfonds Deutschland). IFB AdiposityDiseases is supported by the Federal Ministry of Education and Research (BMBF), Germany, FKZ: 01EO1001. We would like to thank Knut Krohn (Microarray Core Facility of the Interdisciplinary Centre for Clinical Research, University of Leipzig) for the genotyping/analytical support and Joachim Thiery (Institute of Laboratory Medicine, Clinical Chemistry and Molecular Diagnostics, University of Leipzig) for clinical chemistry services. We thank Nigel W. Rayner (WTCHG, University of Oxford, UK) for the excellent bioinformatics support. Reedik Mägi is funded by European Commission under the Marie Curie Intra-European Fellowship and by Estonian Government (grant #SF0180142s08).

**SPT:** Our chief acknowledgement is to the participants in these studies for their willingness to contribute. We also thank Nurses Orgen Brown and Diedre Thomas for assistance with recruitment as well as past and present Laboratory technologists and drivers at TMRU for their invaluable technical assistance. This work was supported by NIH Grants R01HL53353 and R01DK075787.

**STR:** This work was supported by grants from the US National Institutes of Health (AG028555, AG08724, AG04563, AG10175, AG08861), the Swedish Research Council, the Swedish Heart-Lung Foundation, the Swedish Foundation for Strategic Research, the Royal Swedish Academy of Science, and ENGAGE (within the European Union Seventh Framework Programme, HEALTH-F4-2007-201413). Genotyping was performed by the SNP&SEQ Technology Platform in Uppsala ([www.genotyping.se](http://www.genotyping.se)). We thank Tomas Axelsson, Ann-Christine Wiman and Caisa Pöntinen for their excellent assistance with genotyping. The SNP Technology Platform is supported by Uppsala University, Uppsala University Hospital and the Swedish Research Council for Infrastructures.

**Tandem:** We thank the Ministry of Health of the Republic of Seychelles for continued support of this epidemiologic research and Air Seychelles and SkyChef for their logistic support in transporting equipment and samples. The study benefited from grants from the Swiss National Science Foundation (TANDEM No 31-51115.97, PROSPER 3200BO-111362/1, and 3233BO-111361/1); Murielle Bochud was supported by the Swiss School of Public Health Plus. The division of Nephrology and the Institute of Social and Preventive Medicine of Lausanne University Hospital (Lausanne, Switzerland) provided additional logistic support. Georg Ehret is supported by the University of Geneva and the Swiss National foundation.

**THISEAS:** Recruitment for THISEAS was partially funded by a research grant (PENED 2003) from the Greek General Secretary of Research and Technology; we thank all the dieticians and clinicians for their contribution to the project.

**TRAILS:** This research is part of the TRacking Adolescents' Individual Lives Survey (TRAILS). Participating centers of TRAILS include various departments of the University Medical Center and University of Groningen, the Erasmus University Medical Center Rotterdam, the University of Utrecht, the Radboud Medical Center Nijmegen, and the Parnassia Bavo group, all in the Netherlands. TRAILS has been financially supported by various grants from the Netherlands Organization for Scientific Research NWO (Medical Research Council program grant GB-MW 940-38-011; ZonMW Brainpower grant 100-001-004; ZonMw Risk Behavior and Dependence grants 60-60600-97-118; ZonMw Culture and Health grant 261-98-710; Social Sciences Council medium-sized investment grants GB-MaGW 480-01-006 and GB-MaGW 480-07-001; Social Sciences Council project grants GB-MaGW 452-04-314 and GB-MaGW 452-06-004; NWO large-sized investment grant 175.010.2003.005; NWO Longitudinal Survey and Panel Funding 481-08-013), the Dutch Ministry of Justice (WODC), the European Science Foundation (EuroSTRESS project FP-006), Biobanking and Biomolecular Resources Research Infrastructure BBMRI-NL (CP 32), and the participating universities. We are grateful to all adolescents, their parents and teachers who participated in this research and to everyone who worked on this project and made it possible. Statistical analyses were carried out on the Genetic Cluster Computer (<http://www.geneticcluster.org>), which is financially supported by the Netherlands Scientific Organization (NWO 480-05-003) along with a supplement from the Dutch Brain Foundation.

**Tromsø:** This study was supported under the University of Tromsø, Norwegian Research Council (project number 185764).

**Twingene:** This work was supported by grants from the Ministry for Higher Education, the Swedish Research Council (M-2005-1112 and 2009-2298), GenomEUtwin (EU/QLRT-2001-01254; QLG2-CT-2002-01254), NIH grant DK U01-066134, The Swedish Foundation for Strategic Research (SSF; ICA08-0047).

**ULSAM:** Genotyping was performed by the SNP&SEQ Technology Platform in Uppsala ([www.genotyping.se](http://www.genotyping.se)). We thank Tomas Axelsson, Ann-Christine Wiman and Caisa Pöntinen for their excellent assistance with genotyping. The SNP Technology Platform is supported by Uppsala University, Uppsala University Hospital and the Swedish Research Council for Infrastructures. E.I. is supported by grants from the Swedish Research Council, the Swedish Heart-Lung Foundation, the Swedish Foundation for Strategic Research, and the Royal Swedish Academy of Science.

**WGHS:** The WGHS is supported by HL043851 and HL080467 from the National Heart, Lung, and Blood Institute and CA047988 from the National Cancer Institute with collaborative scientific support and funding for genotyping provided by Amgen.

**WHI Metabochip:** The Population Architecture Using Genomics and Epidemiology (PAGE) program is funded by the National Human Genome Research Institute (NHGRI), supported by U01HG004803 (CALiCo), U01HG004798 (EAGLE), U01HG004802 (MEC), U01HG004790 (WHI), and U01HG004801 (Coordinating Center), and their respective NHGRI ARRA supplements. The contents of this paper are solely the responsibility of the authors and do not necessarily represent the official views of the NIH. The complete list of PAGE members can be found at <http://www.pagestudy.org>. The data and materials included in this report result from collaboration between the following studies: The Multiethnic Cohort study (MEC) characterization of epidemiological architecture is funded through the NHGRI PAGE program (U01HG004802 and its NHGRI ARRA supplement). The MEC study is funded through the National Cancer Institute (R37CA54281, R01 CA63, P01CA33619, U01CA136792, and U01CA98758); Funding support for the “Epidemiology of putative genetic variants: The Women’s Health Initiative” study is provided through the NHGRI PAGE program (U01HG004790 and its NHGRI ARRA supplement). The WHI program is funded by the National Heart, Lung, and Blood Institute; NIH; and U.S. Department of Health and Human Services through contracts N01WH22110, 24152, 32100-2, 32105-6, 32108-9, 32111-13, 32115, 32118-32119, 32122, 42107-26, 42129-32, and 44221. The authors thank the WHI investigators and staff for their dedication, and the study participants for making the program possible. A full listing of WHI investigators can be found at:

[http://www.whiscience.org/publications/WHI\\_investigators\\_shortlist.pdf](http://www.whiscience.org/publications/WHI_investigators_shortlist.pdf); Funding support for the Genetic Epidemiology of Causal Variants Across the Life Course (CALiCo) program was provided through the NHGRI PAGE program (U01HG004803 and its NHGRI ARRA supplement). The following studies contributed to this manuscript and are funded by the following agencies: The Atherosclerosis Risk in Communities (ARIC) Study is carried out as a collaborative study supported by National Heart, Lung, and Blood Institute contracts N01-HC-55015, N01-HC-55016, N01-HC-55018, N01-HC-55019, N01-HC-55020, N01-HC-55021, N01-HC-55022. Assistance with phenotype harmonization, SNP selection and annotation, data cleaning, data management, integration and dissemination, and general study

coordination was provided by the PAGE Coordinating Center (U01HG004801-01 and its NHGRI ARRA supplement). The National Institutes of Mental Health also contributes to the support for the Coordinating Center. The PAGE consortium thanks the staff and participants of all PAGE studies for their important contributions.

**Whitehall:** The Whitehall-II study was supported by the Medical Research Council, the BHF, and the National Institutes of Health (R01HL36310). Whitehall-II genotyping was, in part, supported by a Medical Research Council-GlaxoSmithKline pilot program grant (ID 85374) and the BHF (PG/07/133/24260, RG/08/008, SP/07/007/23671) and a senior fellowship (FS/2005/125). SHE is a British Heart Foundation Chair holder.

**WTCCC-T2D:** WTCCC-T2D was funded in part through Andrew Morris, funding from Wellcome Trust, grant numbers WT081682, WT098017 and WT090532; Mark McCarthy funding from the Wellcome Trust 090532, Wellcome Trust (085301, 081917, 098381, and 090367), European Commission (HEALTH-F4-2007-201413), MRC G0601261. C.M. Lindgren is a Wellcome Trust Research Career Development Fellow (086596/Z/08/Z). M. McCarthy is an NIHR Senior Investigator and a Wellcome Trust Senior Investigator. R. Mägi is funded by European Commission under the Marie Curie Intra-European Fellowship and by Estonian Government (grant #SF0180142s08).

**YFS (Young Finns Study):** The Young Finns Study has been financially supported by the Academy of Finland: grants 134309 (Eye), 126925, 121584, 124282, 129378 (Salve), 117787 (Gendi), and 41071 (Skidi), the Social Insurance Institution of Finland, Kuopio, Tampere and Turku University Hospital Medical Funds (grant 9M048 for 9N035 for TeLeht), Juho Vainio Foundation, Paavo Nurmi Foundation, Finnish Foundation of Cardiovascular Research and Finnish Cultural Foundation, Tampere Tuberculosis Foundation and Emil Aaltonen Foundation.

**Miscellaneous:** T.H. Pers is supported by The Danish Council for Independent Research Medical Sciences (FSS) and the The Alfred Benzon Foundation. Additional support was provided by National Institutes of Health grants DA027040 and T32HL069768; and the American Heart Association 13PRE16930025. C.J. Willer is supported by HL094535 and HL109946. E.M. Schmidt holds a National Science Foundation Open Data fellowship (NSF 0903629). R.J. Strawbridge is supported by Swedish Heart-Lung Foundation (20120600), the Tore Nilsson, Gamla Tjänarinnor and Fredrik and Ingrid Thuring's foundations. B. Sennblad acknowledges funding from the Magnus Bergvall and Gamla Tjänarinnor Foundations.
